Executive Summary

The Family and Juvenile Law Advisory Committee recommends that the Judicial Council receive and accept the report entitled “Review of Statewide Uniform Child Support Guideline 2010” and direct staff to forward it to the Legislature.

The review of California’s statewide uniform child support guideline is legislatively mandated. Family Code section 4054 states that any recommendations for revision to the guideline must be made to ensure that the guideline results in appropriate child support orders, limit deviations from the guideline, or otherwise help to ensure that the guideline is in compliance with federal law. The review provides a basis for the Legislature to periodically reassess California’s child support guidelines and evaluate its impact on children and families.

Recommendation

The Family and Juvenile Law Advisory Committee recommends that the Judicial Council receive and accept the report entitled “Review of Statewide Child Support Guideline 2010” and direct staff to forward it to the Legislature.

Previous Council Action

The 2010 review is the fourth review conducted by the Judicial Council. Previous reviews examined the most current economic evidence on child-rearing expenditures and analyzed case file data to determine how the guideline was being applied and the extent of deviation from the guideline. The economic evidence examined in these earlier reviews suggested that the California guideline formula resulted in appropriate amounts of child support. The analyses of case file data in these earlier reviews found that the guideline was, in general, being applied and that few orders deviated from the guideline.

Prior reviews and recommendations have been instrumental in helping effect changes to the statewide guideline.

The 2005 review recommendations focused on continued monitoring and refinement of certain adjustments, deductions, and additional support but no changes in the basic guideline formula. The 2005 recommendations were:

- Make no changes in the basic California child support guideline formula.
- Research the impact of support orders on low-income families in concert with efforts by the courts, DCSS, and other state entities to help low-income families.
- Increase or index the income threshold for applying the low-income adjustment.
- Address a child’s share of the health insurance premium similarly to the way child-care expenses are treated.
- Clarify the appropriate application of hardship deductions for additional children not of the relationship before the court.
- Encourage better and more detailed information in the case file.

The 2001 review recommendations focused on changes needed regarding the treatment of low-income obligors, the use of gross income versus net income as a base in calculating child support, and the treatment of additional dependents:

- The Legislature should review the adequacy of the low-income adjustment provided by Family Code 4055 in light of the treatment of low-income obligors in other states.
- The California child support guideline should continue to rely on disposable net income as the base used to compute child support obligations.
- The existing California child support guideline’s approach to balancing the needs of additional dependents with the needs of the children subject to the support order before the court adequately addressed those issues.

The 1998 review made no recommendations for revision of the statewide child support guideline, concluding that California guidelines complied with federal requirements and that the vast

majority of support orders issued were appropriate under statutory guidelines. Despite the absence of specific recommendations, however, a number of significant issues were raised in the review that warranted further study, including:

- A lack of thorough documentation in court files to substantiate the factual determinations underlying child support orders;
- The low-income adjustment allowed by Family Code section 4055(b)(7) being granted in only 11% of the cases in which the obligor qualified;
- More study needed of the consideration given to prior or subsequent families in setting child support orders; and
- More study needed to explain the lack of orders for mandatory additional support.

Rationale for Recommendation

The child support guideline review contains the legislatively required areas of study: a review of case files to analyze the application of the guideline to particular cases, an analysis and comparison of selected special factors that are considered by other states' guidelines, and available economic data on the cost of raising children. The current review further includes an evaluation of how California's statewide uniform child support guidelines deal with two additional factors: the treatment of low-income obligors and medical support. As a result of the study, the review makes the following recommendations:

Recommendation 1

Update or modify the low-income adjustment in the guideline.

The current guideline provides for a low-income adjustment when the obligor's net income is below \$1,000 per month. The \$1,000 threshold has never been updated, and, unlike most low-income adjustments in other state guidelines, it does not relate to the federal poverty guidelines for one person or full-time minimum wage earnings. Moreover, this threshold is inadequate, and research suggests that it could inadvertently reduce the obligor's incentive to work in the legitimate economy, pay support, and maintain contact with the child—potentially resulting in other adverse consequences to child outcomes. The income threshold is too low to apply to common situations when payment of the existing guideline amount leaves the obligor with income below poverty level. For example, a minimum wage earner would not be eligible for the current low-income adjustment.

This recommendation does not endorse any single approach to dealing with low-income obligors but recognizes the need for California to reassess its low-income adjustment in light of current social and economic circumstances in California and in light of the effective practices of other states.

Recommendation 2

Evaluate current income attribution policies as it applies to both parents. This includes codifying case law on income imputation and reviewing the existing income presumption provision to determine if it continues to be consistent with the legislative principles regarding child support.

California's provision for income imputation is thin and lacking in detail relative to most state guidelines. However, California case law (*In re Marriage of Regnery* (1989) 214 Cal.3d 1367) spells out what should be considered when imputing income as thoroughly as any other state's guideline provision for income imputation. It would benefit guideline users, particularly parents, if this case law were codified. It would improve the transparency of California's income imputation policy and make the guideline outcome more predictable for parents. Further, current law limits the circumstances when income can be imputed to the custodial parent.

The current income presumption policy implicitly presumes that obligors in IV-D cases can and should find full-time work at minimum wage. While many states make similar presumptions when imputing income, most states also consider local employment opportunities as part of the process. In addition, if the Legislature re-examines the approach to low-income obligors, as recommended in this study, it will need to determine if these changes should also apply to cases in which presumed income is used to determine the child support obligation.

Recommendation 3

Educate stakeholders and equip them with information so that they can make the current system work better. In addition, develop strategies to engage stakeholders and encourage their active participation in the child support process.

One of the recurring themes of this study is the stress that the economic recession has put on families and obligors, yet parents are not fully using all of the guideline provisions intended to deal with each case's unique economic circumstances. The low-income adjustment is not applied in all cases in which obligors are eligible. The percentage of parents with hardship deductions is down, even though logic suggests that more parents should be seeking such deductions during an economic recession. Fewer orders are being entered for the child's uninsured medical expenses despite so many parents having lost employee health benefits. Parents do not understand that their orders are not automatically modified when they lose their jobs.

In addition, the case file data suggest that fewer parents now have the opportunity to learn how the guideline works. Fewer parents are represented by attorneys and more orders are being entered by default, an indication that the parent is not involved in the order establishment process. Obligor who are subject to orders obtained by default typically lack contact with DCSS workers, family law facilitators, judges, or commissioners—the very people we rely on to educate parents about the guideline.

Involvement and education have ripple effects. When parents better understand the guideline, they become engaged in the process, are more forthcoming with information (such as documentation of actual earnings or child-care expenses), know when and how to seek a modification, and can understand and apply guideline provisions for unique situations when appropriate (such as the low-income adjustment when the obligor is eligible).

Recommendation 4

Adopt any necessary conforming changes so that California can meet the 2008 federal medical support rules, but also recognize that the 2010 national health reform may produce future changes to the federal rules as well as changes in how states approach medical support.

For the most part, California has the statutory framework needed to meet the 2008 federal medical support rules. Senate Bill 580, chaptered on July 15, 2010, incorporated provisions to modify existing California law to meet federal medical support requirements. Additional statutory changes may be necessary depending on the impact of national health reform measures or further changes to the federal rules.

Recommendation 5

Encourage better and more detailed information in the case file.

Income information, order amounts, guideline amounts in orders with deviations, and other pertinent information were missing in a notable number of case files reviewed. For some parents, this is the only record they have of the basis of their orders. When a parent becomes unemployed or experiences a hardship or other circumstance that might warrant a modification, it is important that the file contain a complete record of how the court or DCSS determined the original order amount.

Comments, Alternatives Considered, and Policy Implications

California Family Code 4054 sets forth groups who should be consulted during the guideline study process. In developing its recommendations, the Judicial Council shall consult with a broad cross-section of groups involved in child support issues, including but not limited to

- Custodial and non-custodial parents;
- Representatives of established women's rights and fathers' rights groups;
- Representatives of established organizations that advocate for the economic well-being of children;
- Members of the judiciary, district attorneys' offices, the Office of the Attorney General, and the Department of Child Support Services;
- Certified family law specialists;
- Academics specializing in family law;
- Persons representing low-income parents; and
- Persons representing recipients of CalWorks benefits seeking child support services.

The code does not specify the mechanisms to be used to achieve this outreach to interested stakeholders. The approach used here involved contact with the Department of Child Support Services during the planning stage of the study for input on the research questions to be focused on in this review. DCSS provided advance input that represented input from additional stakeholders, including local child support agencies and advocacy representatives who meet periodically with DCSS. In addition, as part of the study itself, the research consultants

conducted several focus groups that included various advocacy groups and child support commissioners.

The public comment period also afforded remaining stakeholders with an opportunity to provide direct input for the study and its recommendations. In addition to publishing the draft study on the judicial branch's website, extensive outreach was conducted to make stakeholders aware of the public comment period. Electronic notifications were sent to a list of advocates developed by the research consultants as well as to other parties who had expressed interest to the AOC. Various legal publications published notices to help reach the legal community.

The draft report was circulated for comment during the period from November 30, 2010 to January 28, 2011. A total of 44 comments were received. The comments have been attached as part of the appendices to the study to make them available for consideration by the Legislature.

Implementation Requirements, Costs, and Operational Impacts

There are no costs associated with implementing this study other than the one-time cost of conducting and printing the study. The cost of conducting the study included the cost of conducting a request for proposals to obtain an independent research consultant, the cost of the research consultant's contract, and the cost of conducting the court case file review. The cost of the study was covered by federal funds plus a 34 percent state match. The cost of implementing any of the general recommendations in this study would depend on the specific remedy chosen. Should the Legislature take action to implement any or all of these recommendations, the cost of such action would be evaluated as part of the standard legislative process.

Relevant Strategic Plan Goals and Operational Plan Objectives

The recommendations of the Review of the Statewide Uniform Child Support Guidelines address the following Judicial Council strategic plan goals:

Goal I: Access, Fairness and Diversity and Goal IV: Quality of Justice and Service to the Public. This goal is addressed by all of the recommendations in this study as the recommendations will promote fair and just treatment of all litigants involved in these proceedings. Further, the recommendations promote making court procedures more understandable by the public and provide them with access to a better record of the proceedings in which they may be involved.

Executive Summary

This report is prepared pursuant to California Family Code section 4054(a), which requires that, at least every four years, the Judicial Council review the Statewide Uniform Child Support Guideline to recommend appropriate revisions to the Legislature. Federal regulations (45 C.F.R. § 302.56) also require that each state review its guideline at least every four years. The primary purpose of this review requirement is to ensure that the guideline results in the determination of appropriate child support award amounts. Federal and state requirements additionally specify that the review must include an assessment of the economic data on child-rearing costs and a review of case data to analyze the application of the guideline and to ensure that deviations from the guideline are limited.

In January 2010, the Judicial Council, through a competitive bidding process, contracted with the Center for Policy Research (CPR) to provide technical assistance for California's child support guideline review. Federal and state requirements for review of the guideline were met through the following activities:

- Reviewing the economic studies underlying the existing California guideline formula;
- Conducting a literature review of studies estimating child-rearing expenditures, including the most recent economic evidence, and comparing the results of these studies with the parameters of the California guideline formula;
- Examining other economic factors considered in the guideline formula (e.g., the adjustment for low-income obligors);
- Examining California's and other states' treatment of medical support in the context of new federal medical support requirements (including the requirements pertaining to reasonable cost of medical support and cash medical support), health reform, and California's health-care delivery system and health-care costs;
- Collecting and analyzing case file data from a review of recently established and modified child support orders;
- Measuring how frequently the guideline is applied and deviated from, as well as the reasons for, amount of, and upward and downward direction of deviations;
- Analyzing parents' characteristics and circumstances in which support is established or modified;
- Adding context to the statistical results of case data analysis and improving interpretation through focused discussion groups with a broad cross-section of child support commissioners and stakeholder groups involved in child support issues;
- Seeking input from stakeholders about the comprehensiveness and fairness of the California guideline; and
- Comparing selected provisions of the California guideline and their application with those of other states' guidelines.

Background

California Guideline and Federal Regulations

The California Legislature adopted the Statewide Uniform Child Support Guideline (referred to generally throughout this report as the “guideline”) in 1992. Prior to that time, California had a statewide minimum amount guideline and several county guidelines that judges could apply. The statewide guideline was adopted to comply with federal regulations for child support guidelines (see Fam. Code, § 4050). Federal regulations (45 C.F.R. § 302.56(a)) require states to establish by law or by judicial or administrative action one set of guidelines for setting and modifying child support award amounts. According to 45 Code of Federal Regulations part 302.56(f), a state guideline must provide a rebuttable presumption, in any judicial or administrative proceeding for the award of child support, that the amount of the award that would result from the statewide uniform guideline is the correct amount of child support to be awarded.

Overview of the California Guideline Formula

The California guideline considers all earnings and income of both parents because its premise is that both parents are responsible for supporting their children (Fam. Code, § 4053(b)). The core, basic formula for determining the amount of the child support order under the California guideline is based on the following factors:

- Each parent’s net disposable income;
- The parents’ total net disposable income;
- The number of children; and
- The percentage of time that each parent has primary physical responsibility for the children.

The California guideline provides for other adjustments to income, such as child support being paid for other children and other children being supported in the home. The guideline provides for adjustments to the support order amount, including adjustments for additional support, in cases involving factors such as uninsured health-related expenses, low-income obligors, and work-related child-care expenses.

Proceedings for Establishing or Modifying Child Support Orders

California superior courts establish and modify child support orders. Certain child support orders—those established or modified pursuant to part D of Title IV of the Social Security Act (commonly referred to as the “IV-D program”)—are established within California’s child support commissioner system (Fam. Code, § 4250). Under Title IV-D, a local department of child support services (DCSS) can file petitions to establish parentage, obtain and collect child support, obtain and enforce health insurance coverage for the child, and modify an order. IV-D services are automatically provided in cases where public assistance monies have been expended. IV-D services are also provided in non–public assistance cases at the request of a parent for a \$25 fee.¹ The purpose of DCSS is to work with parents and guardians to ensure that

¹ Federal law (Deficit Reduction Act of 2005, Pub.L. No. 109-171 (Feb 8, 2006) 42 U.S.C. § 1305 et. seq.) requires states to impose a \$25 annual fee in non–public assistance cases.

children and families receive court-ordered financial and medical support. Through a network of 52 county and regional child support agencies DCSS serves approximately 1.8 million children. Services include locating a parent; establishing paternity; establishing, modifying, and enforcing a court order for child support; and establishing, modifying, and enforcing an order for health-care coverage. The federal government and, in part, states fund the IV-D program.

In California, the local DCSS files the initial complaint in IV-D program cases in the name of the county in which the application for Title IV-D services is made. The attorney for the local child support agency does not represent the custodial parent; instead, the custodial parent is named as a party to the order once the order is established. Either parent can apply for Title IV-D services and/or use the IV-D program to request a modification, including an obligor who is seeking a downward modification.

Child support commissioners hear all support actions (child and spousal) and paternity actions filed by the local DCSS. The commissioner's duties include taking testimony, establishing a record, evaluating evidence, making decisions or recommendations, and entering judgments or orders based on stipulated agreements. Family law facilitators are attorneys employed by the court and available to assist either parent with child support or other family law issues in cases heard by commissioners. For example, family law facilitators provide parents with educational materials, distribute and help complete necessary court forms, and prepare guideline calculations. However, this interaction between facilitators and parents does not create an attorney-client relationship.²

“Non-IV-D cases” are those in which child support orders are established and modified outside the commissioner system. A number of large and medium-sized counties have dedicated family law courts to hear cases involving child support or other family law issues (e.g., custody, visitation, dissolution of marriage, and domestic violence). The role of these courts in hearing child support cases is to take testimony, establish a record, evaluate evidence, make decisions as to support, enter judgment or orders, and approve stipulated agreements between parties. Under Family Code section 4065, the parties to a child support order may stipulate to an amount of support, provided the court finds that the parties have been informed of their rights, that the parties were not coerced into agreeing to the stipulation, and that the agreement is in the best interest of the children.

Previous Reviews and Recommendations

The 2010 review is the fourth conducted by the Judicial Council.³ Prior reviews have been instrumental in helping effect changes in the statewide uniform guideline. Specifically, the most recent review, conducted in 2005, suggested continued monitoring and refinement of certain

² Fam. Code, § 10013.

³ See Judicial Council of Cal., *Review of Statewide Uniform Child Support Guideline* for 1998, 2001, and 2005. Available at www.courtinfo.ca.gov/programs/cfcc/resources/publications/articles.htm#childsupport.

adjustments, deductions, and additional support for other factors such as child care but no changes to the basic guideline formula.

The most recent significant changes affecting the guideline concerned changes to the low-income adjustment and presumption of income. In August 2003, the Legislature changed the low-income adjustment provision to make a rebuttable presumption that any obligor qualifying for the low-income adjustment should be granted the low-income adjustment (set out in Fam. Code, § 4055(b)(7) at net income below \$1,000 per month). Previously, the court had to justify granting the low-income adjustment by indicating in writing or on the record the reason for granting the adjustment. In August 2004, the Legislature changed the provision regarding the presumption of income (set out in Fam. Code, § 17400(d)(2)) to set presumed income at 40 hours per week at minimum wage.

Data and Analytical Methodology

Assessment of the Economic Cost of Child Rearing

The assessment of the economic cost of child rearing included a review of the principles underlying state guidelines, specifically the principle related to the cost of raising children; a literature review of the studies of child-rearing expenditures underlying state guidelines and the studies that contained more current estimates; and developing new estimates of child-rearing expenditures from the most current expenditure data available (i.e., up to the first quarter of 2009 in the Consumer Expenditures Survey conducted by the Bureau of Labor Statistics). This was deemed necessary because the extant studies did not include data for the years after the economic recession began in December 2007 or were known to overstate actual child-rearing expenditures. In all, eight studies of child-rearing expenditures were identified and then compared to elements of the California guideline formula (e.g., percentage of income allocated to child-rearing expenditures, multipliers for two or more children). Other factors that affect state guideline differences were identified through the focus groups and the literature reviewed and then were analyzed. The amounts under the California guideline were compared to those of other states to illustrate some points. All calculations were based on automated guideline calculators from a state agency or court Web site.

Case File Review

A random sample of 1,226 child support orders entered in 2008 was drawn to analyze how the guideline is being applied and to what extent and why deviations occur. The sample spanned the same 11 study counties as in the last review. The counties range in size and socioeconomic factors to reflect the diversity of California. The sample included almost equal shares of IV-D and non-IV-D cases. To aid our analysis, the preliminary findings were shared in two focus groups with representatives of advocacy groups and commissioners of the study counties.

Additional Analysis of Low-Income Families

The analysis consisted of a literature review of low-income noncustodial parents and a review of each state's guideline. The low-income adjustment, minimum order, self-support reserve, income

attribution provision, and other information were noted for each state guideline and later categorized to determine how many states used certain approaches. The reviews were supplemented with a comparison of state guideline amounts for four low-income case scenarios. When available, automated guideline calculators from a state agency or court Web site were used to make the calculations; otherwise, the calculations were performed manually.

Additional Analysis of Medical Support

Each state's guideline was reviewed to determine what changes were made, if any, to conform to the 2008 federal medical support requirements. We also reviewed recent information about health reform and health-care costs in California. Information from recent medical support demonstration grants, the federal Office of Child Support Enforcement, and conference presentations of professional child support organizations was also examined.

Focus Groups With Stakeholders

Three focus groups with stakeholders were conducted. The first two focus groups (one held in Northern California and the other in Southern California) gathered stakeholders' perspectives on the comprehensiveness and fairness of the guideline as well as recommended improvements. Stakeholders participating in the third focus group reviewed preliminary findings of the case file review and shared their insights to add context and interpretation to the analysis. In all, CPR identified 48 individuals representing various groups. Participants received e-mail invitations to attend the focus group taking place in their region, followed by faxed invitations and telephone calls to increase the number of invitees confirming attendance. Not more than 15 invitees showed up for any one focus group.

CPR developed interview guides for the focus groups. For some questions, a round-robin approach was used to engage all focus group participants. A short survey was also administered in the first two focus groups. The focus groups were audiotaped and transcribed. Meeting notes and transcriptions were used to identify common themes.

Conclusions

***Conclusion 1:** The California guideline and 36 other state guidelines are based on a "continuity-of-expenditures model"—that is, the child support award should allow the children to benefit from the same level of expenditures that would have been provided had the children and both parents lived together. State guidelines based on this concept apply it equally to children of divorce and children of unmarried parents, regardless of whether the parents ever lived together, because most states believe that children should not be the economic victims of their parents' decisions to live apart. Most of these states, including California, base their guideline formulas on measurements of child-rearing expenditures in intact families and periodically assess their formulas against newer measurements to ensure that they produce an adequate amount.*

Conclusion 2: *The California guideline formula is generally within the range of measurements of child-rearing expenditures—but at the high end of the range of measurements of child-rearing expenditures.* This assessment is based on comparisons of the California guideline to eight measurements of child-rearing expenditures, including those that underlie other state guidelines and current measurements.

Conclusion 3: *Many other assumptions and factors besides measurements of child-rearing expenditures form a guideline formula.* These include how the guideline formula adjusts for higher income, obligee income, and shared physical responsibility, as well as the use of gross or net income as the guideline basis. California’s approach to some of these factors creates some anomalies and differences from other state guidelines in certain circumstances, but they are generally limited or inconsequential.

Conclusion 4: *The percentage of orders that deviated from the guideline has increased.* The 2010 study found guideline deviations in 15 percent of the cases reviewed. Commissioners and stakeholders attribute the increase to the economic recession and better-educated parents.

Conclusion 5: *Commissioners and advocates agreed that the current low-income adjustment is inadequate.* Fifteen percent of the obligors in the case file review had incomes below \$1,000 net per month and so were eligible for the low-income adjustment. Despite increases in the minimum wage, this is the same percentage of obligors who were eligible during the last review. It is indicative of the economic distress that many parents currently face as a result of high rates of under- and unemployment and the lack of even low-paying jobs.

Conclusion 6: *Many of the guideline factors designed to yield more responsive orders are being applied very infrequently.* A hardship deduction is being made to the incomes of only 4 percent of the parents. Orders for additional support also are infrequent. Orders for work-related child-care expenses are applied in 12 percent of the cases, and orders for uninsured health-care costs are applied in 18 percent of the cases. Other adjustments to income and orders for other additional support are applied even less frequently. Commissioners attribute these trends to the economic downturn, a higher rate of default orders, and a smaller proportion of modified orders in the sample.

Conclusion 7: *The percentage of orders entered through default, 46 percent, is back up. This is after a concerted effort several years ago to lower the number of orders entered by default in California.*⁴

Conclusion 8: *The percentage of orders involving presumed income has increased since the last guideline review. The percentage of orders with income imputation, however, has not increased.* State statute requires that income be presumed in IV-D cases when the obligor’s income or

⁴ As discussed in Chapter 4 of the report, default orders are correlated with nonpayment. The general premise is that payments will be higher when parents are engaged in the order establishment or modification process.

income history is unknown. State statute provides that income can be imputed in any child support case (regardless of IV-D status) based on the parent's earning potential.

Conclusion 9: *Health insurance is frequently ordered, and medical support is ordered in most IV-D cases.* The latter is important because of new federal medical support rules that became effective in 2008.

Conclusion 10: *Information is frequently missing from case files.* Critical information was missing in many child support cases reviewed for this study. Ten percent lacked documentation of the calendared child support court event; 19 percent did not contain information on the parents' income; 9 percent lacked information on the child support order; and 22 percent did not specify the guideline amount.

Conclusion 11: *Historically, many IV-D families and obligors have poverty or low incomes. The current high unemployment and underemployment rates likely contribute to even higher incidences of poverty and low income than were previously documented.* This review considers how other states address low-income parents and how poverty and low income create special circumstances that need to be addressed when determining appropriate child support amounts.

Conclusion 12: *When child support obligations are set too high for low-income obligors, they are unable to meet their own subsistence needs.* This leads to many severe consequences: a reduced incentive to work and to work in the mainstream economy; depressed child support payments; higher arrears balances; and attenuated parent-child relationships, which in turn, can adversely affect child outcomes.

Conclusion 13: *The California guideline amounts for low-income obligors are high relative to other states. The low-income adjustment under the California guideline is inadequate.* Unlike the low-income adjustment used in many state guidelines, it does not relate to the federal poverty guideline for one person. Its income threshold (i.e., the low-income adjustment applies when obligor net income is less than \$1,000 per month) has never been updated. The income threshold is too low to apply to typical low-income situations (i.e., obligors earning minimum wage); hence these low-income obligors are not eligible for the low-income adjustment, and payment of the unadjusted guideline amount leaves the obligor with insufficient income to live above poverty level.

Conclusion 14: *California's income presumption policy exacerbates the guideline problems for low-income parents; the obligor's income is often presumed to be more than it actually is or job opportunities available for obligors are presumed to pay more than they actually do.* Family Code section 17400(d)(2) provides that if a support obligation is being established by the local child support agency and the obligor's income or income history is not known, income is presumed at minimum wage for 40 hours per week. Presuming income above an obligor's actual income can produce a much higher order than the amount that would have resulted had the guidelines been applied to the parent's actual income.

Conclusion 15: *Although the 2008 federal medical support rules impose many new requirements on states—including state provisions for the establishment and modification of medical support—2010 health reform will likely change future federal medical support requirements.* The federal Office of Child Support Enforcement (OCSE) is currently assessing whether current federal medical support policies are congruent with 2010 health reform. They anticipate changes, but the scope of those changes is currently unknown.

Conclusion 16: *California statute already provides that either or both parents can be ordered to provide insurance coverage for the children and that orders allocate the child's uninsured health-care expenses between the parents.* The 2008 federal medical support rule that applies directly to state guidelines mandates that a state guideline provide for how the child's health-care needs will be addressed.⁵ This encompasses orders for one or both parents to carry insurance for the child, orders for how the child's uninsured health-care expenses will be allocated between the parents, and other types of medical support.

Conclusion 17: *California statute currently does not provide an income-based definition of "reasonable cost" but does address what is "accessible" health-care. Although not called "cash medical support" (and states are not required to use the federal term), California's provision of reasonable uninsured health-care expenses is a form of cash medical support.* To assist with the implementation of the 2008 federal medical support rule that requires IV-D agencies to petition for health insurance that is reasonable in cost and accessible to the child and/or "cash medical support," many states are including definitions of "reasonable cost," "accessible," and "cash medical support" in their guidelines. The 2008 federal rule provides for considerable state discretion in these definitions; however, the reasonable cost definition must be income based. (Note: Senate Bill 580 (Wright; Stats 2010, ch 103) was enacted and now implements the rule)

Conclusion 18: *The California guideline adjusts for the child's health insurance differently than most state guidelines. While most states prorate the child's share of the insurance premium between the parents, California subtracts the insurance premium from the parent's income.* Depending on which parent pays the premium, the support award is increased or decreased by the other parent's share. States that have recently replaced the subtraction method for the proration method find that the subtraction method was not a sufficient adjustment for skyrocketing premiums and that the proration method is easy and fair.

Conclusion 19: *Focus group discussions among advocates reveal that parents frequently fail to comprehend what goes into the guideline calculation and need more education to improve their understanding.* Advocates suggest that parents receive more education so that they better understand the factors that go into the guideline calculation. They believe that parents who do not understand the guideline sometimes distrust the calculation and/or resent the system.

⁵ 45 C.F.R. § 302.56(3).

Conclusion 20: *Advocates who attended the focus groups consistently believed that the guideline is unfair to low-income parents. Many advocates expressed concern about how the guideline treats low-income parents, and low-income noncustodial parents in particular.*

Conclusion 21: *Many of the advocates' issues concerned systematic issues involving the guideline or were beyond the scope of the guideline. Advocates participating in the focus groups saw the guideline as interrelated and inseparable from other family law issues, including custody and court and agency rules and procedures. In all, advocates believed these interrelated issues create parental conflict that is harmful to child well-being.*

Recommendations

Recommendation 1: *Update and/or modify the low-income adjustment in the guideline. The current guideline provides for a low-income adjustment when the obligor's net income is below \$1,000 per month. The \$1,000 threshold has never been updated and, unlike most low-income adjustments in other state guidelines, it does not relate to the federal poverty guidelines for one person or full-time minimum wage earnings. Moreover, it is inadequate, and research findings suggest that it inadvertently could reduce the obligor's incentive to work in the legitimate economy, pay support, and maintain contact with the child, potentially resulting in other adverse effects on child outcomes.*

Recommendation 2: *Evaluate the current income attribution policies as it applies to both parents. This includes codifying case law on income imputation and reviewing the existing income presumption provision to determine if it continues to be consistent with the legislative principles regarding child support.*

Recommendation 3: *Educate stakeholders and equip them with information so they can make the current system work better. In addition, develop strategies to engage stakeholders and encourage their active participation in the child support process. Involvement and education have ripple effects. When parents understand the guideline better, they are more engaged in the child support process, are more forthcoming with information, know when and how to seek modification, and can understand and use the guideline provisions for unique situations when appropriate.*

Recommendation 4: *Adopt any necessary conforming changes so that California can meet the 2008 federal medical support rules, but also recognize that 2010 national health reform may produce changes to the federal rules in the future as well as changes in how states approach medical support. For the most part, California has the statutory framework needed to meet the 2008 federal medical support rules. One possible exception is that California statute does not provide an income-based definition of reasonable cost of insurance.*

Recommendation 5: *Encourage better and more detailed information in the case file. Income information, order amounts, guideline amounts in orders with deviations, and some other*

pertinent information were missing in a notable number of case files. For some parents, this is the only record they have of the basis of the order. If a parent ends up needing a modification, it is important that the file contain a complete record of how the court arrived at the original order amount.

CHAPTER I

Introduction

Purpose of the Study

This report is prepared pursuant to the California Family Code section 4054(a), which requires that, at least every four years, the Judicial Council review the Statewide Uniform Child Support Guideline to recommend appropriate revisions to the Legislature. Federal regulations (45 C.F.R. § 302.56) also require that each state review its guideline at least every four years. The primary purpose of this review requirement is to ensure that the guideline results in the determination of appropriate child support award amounts. Federal and state requirements additionally specify that the review must include an assessment of the economic data on child-rearing costs and a review of case data to analyze the application of the guideline and to ensure that deviations from the guideline are limited.

The California Guideline and Federal Regulations

The California Legislature adopted the Statewide Uniform Child Support Guideline (referred to generally throughout this report as the “guideline”) in 1992. Prior to that time, California had a statewide minimum amount guideline and several county guidelines that judges could apply. The statewide uniform guideline was adopted to comply with federal regulations for child support guidelines (see Fam. Code, § 4050). Federal regulations (45 C.F.R. § 302.56(a)) require states to establish by law or by judicial or administrative action one set of guidelines for setting and modifying child support award amounts. According to 45 Code of Federal Regulations, part 302.56(f), a state guideline must provide a rebuttable presumption, in any judicial or administrative proceeding for the award of child support, that the amount of the award that would result from the statewide guideline is the correct amount of child support to be awarded.

Federal regulations (45 C.F.R. § 302.56(c)) further specify that a state guideline must:

- Take into consideration all earnings and income of the noncustodial parent;
- Be based on specific descriptive and numeric criteria and result in a computation of the support obligation; and
- Provide for children’s health-care needs, through health insurance coverage and/or through cash medical support in accordance with part 303.31.

The last provision refers to a requirement that state child support agencies petition for cash medical support when establishing or modifying a child support order. It was added to the federal requirement in 2008.

In addition, federal regulations require each state to determine criteria that would permit rebuttal of the presumptive guideline where its application would be unjust or inappropriate and not in the child's best interest.

Guideline Calculation

Income Used in the California Guideline

The California guideline considers all earnings and income not only of the noncustodial parent but of both parents, because its premise is that both parents are responsible for supporting their children (Fam. Code, § 4053(b)). This obligation, however, does not extend to the parents' new spouses. In fact, the California guideline provides that the income of an obligor parent's subsequent spouse or nonmarital partner shall not be considered when determining or modifying child support (Fam. Code, § 4057.5(a)(1)).

Description of the Numeric Formula

The core, basic formula for determining the amount of the child support order under the California guideline is based on the following factors:

- Each parent's net disposable income;
- The parents' total net disposable income;
- The number of children; and
- The percentage of time that each parent has primary physical responsibility for the children.

The California guideline provides for other adjustments to income, such as child support being paid for other children and other children being supported in the home. The guideline provides for adjustments to the support order amount, including adjustments for additional support, in cases involving factors such as uninsured health-related expenses, low-income obligors, and work-related child-care expenses.

More specifically, Family Code section 4055(a) provides that the statewide uniform guideline for determining child support orders is:

$$CS = K[HN - (H\%)(TN)]$$

where *CS* means the "child support" amount determined by the formula to be payable for one child. *CS* is multiplied by an incremental variable for every additional child. The factors are shown below.

1.6 for 2 children	2.0 for 3 children	2.3 for 4 children
2.5 for 5 children	2.65 for 6 children	2.75 for 7 children
2.813 for 8 children	2.844 for 9 children	2.86 for 10 children

K stands for the amount of both parents' net income allocated to child support as calculated using the steps in this paragraph. Another variable in the formula, *H%*, is used to calculate *K*. *H%*

stands for the amount of time the high earner has primary physical responsibility for the children as compared to the other parent. When parents have different time-sharing arrangements for different children, $H\%$ stands for the average of the approximate percentage of time the high earner spends with each child. If $H\%$ is less than or equal to 50 percent, then K is calculated by adding 1 to the $H\%$ and then multiplying by the relevant K -fraction from the box below. If $H\%$ is greater than 50%, K equals 2 minus $H\%$ multiplied by the pertinent K -fraction:

Total net disposable income per month	K -fraction
\$ 0–\$800	$0.20 + TN/16,000$
\$801–\$6,666	0.25
\$6,667–\$10,000	$0.10 + 1,000/TN$
Over \$10,000	$0.12 + 800/TN$

None of these income ranges or K -fractions have been updated since the guideline was developed.

HN (bold) stands for the net monthly disposable income of the high earner between the two parents.

$H\%$ (bold) is defined above.

TN stands for the parents’ total net disposable income.

An example is illustrated in Exhibit 1-1.

Exhibit 1-1: Illustration of California Formula Calculation: One Child			
	High Earner	Low Earner	Total
Net disposable income per month	\$4,000 (HN)	\$1,000	\$5,000 (TN)
Amount of time higher earner has with the child	20% ($H\%$)		
K -fraction	0.25		
$K = k\text{-fraction} \times (1 + H\%)$	$(K) = 0.30 = 0.25 \times (1 + 0.20)$		
Child Support $CS = K[HN - (H\%)(TN)]$	$(CS) = .30 [4,000 - (.20)(5,000)]$ $= .30 [4,000 - 1,000]$ $= .30 [3,000]$ $= \$900$		

Children’s Health-Care Needs

The California Family Code provides for children’s health-care needs in several sections, including section 4062, which provides for reasonable uninsured health-care costs for children, and section 3751 et seq., which establishes criteria for ordering health insurance coverage for children.

Guideline Deviation Criteria

Family Code section 4057(b) provides deviation criteria in accordance with federal requirements. These criteria are listed in Chapter 3 as part of the discussion of results from case data analysis of guideline applications and deviations.

Proceedings for Establishing or Modifying Child Support Orders

California superior courts establish or modify child support orders. Certain child support orders—those established or modified pursuant to part D of Title IV of the Social Security Act (commonly referred to as the “IV-D program”)—are established within California’s child support commissioner system (Fam. Code, § 4250). Under Title IV-D, a local department of child support services (DCSS) can file petitions to establish parentage, obtain and collect child support, obtain and enforce health insurance coverage for the child, and modify an order. IV-D services are automatically provided in cases where public assistance monies have been expended. IV-D services are also provided in non–public assistance cases at the request of a parent for a \$25 fee.⁶ The purpose of DCSS is to work with parents and guardians to ensure that children and families receive court-ordered financial and medical support. Through a network of 52 county and regional child support agencies DCSS serves approximately 1.8 million children. Services include locating a parent; establishing paternity; establishing, modifying, and enforcing a court order for child support; and establishing, modifying, and enforcing an order for health coverage. The federal government and, in part, states fund the IV-D program.

In California, the local DCSS files the initial complaint in IV-D program cases in the name of the county in which the application for Title IV-D services is made. The attorney for the local child support agency does not represent the custodial parent; instead, the custodial parent is named as a party to the order once the order is established. Either parent can apply for Title IV-D services and/or use the IV-D program to request a modification, including an obligor who is seeking a downward modification.

Child support commissioners hear all support actions (child and spousal) and paternity actions filed by the local DCSS. The commissioner’s duties include taking testimony, establishing a record, evaluating evidence, making decisions or recommendations, and entering judgments or orders based on stipulated agreements. Family law facilitators are attorneys employed by the court and available to assist either parent with child support or other family law issues in cases heard by commissioners. For example, family law facilitators provide parents with educational materials, distribute and help complete necessary court forms, and prepare guideline calculations. However, this interaction between facilitator and parent does not create an attorney-client relationship.⁷

⁶ See *supra* note 1.

⁷ Fam. Code, § 10013.

“Non-IV-D cases” are those in which child support orders are established and modified outside the commissioner system. A number of large and medium-sized counties have dedicated family law courts to hear cases involving child support or other family law issues (e.g., custody, visitation, dissolution of marriage, and domestic violence). The role of these courts in hearing child support cases is to take testimony, establish a record, evaluate evidence, make decisions as to support, enter judgment or orders, and approve stipulated agreements between parties. Under Family Code section 4065, the parties to a child support order may stipulate to an amount of support, provided the court approves that the parties have been informed of their rights, that the parties were not coerced into agreeing to the stipulation, and that the agreement is in the best interest of the children.

Activities of the 2010 Guideline Review

In January 2010, the Judicial Council, through a competitive bidding process, contracted with the Center for Policy Research (CPR) to provide technical assistance for California’s child support guideline. Federal and state requirements for review of the guideline were met through the following activities:

- Reviewing the economic studies underlying the existing California guideline formula;
- Conducting a literature review of studies estimating child-rearing expenditures, including the most recent economic evidence, and comparing the results of these studies with the parameters of the California guideline formula;
- Examining other economic factors considered in the guideline formula (e.g., the adjustment for low-income obligors);
- Examining California’s and other states’ treatment of medical support in the context of new federal medical support requirements (including the requirements pertaining to reasonable cost of medical support and cash medical support), health reform, and California’s health-care delivery system and health-care costs;
- Collecting and analyzing case file data from a review of recently established and modified child support orders;
- Measuring how frequently the guideline is applied and deviated from, as well as the reasons for, amount of, and upward and downward direction of deviations;
- Analyzing parents’ characteristics and circumstances in which support is established or modified;
- Adding context to the statistical results of case data analysis and improving interpretation through focused discussion groups with a broad cross-section of child support commissioners and stakeholder groups involved in child support issues;
- Seeking input from stakeholders about the comprehensiveness and fairness of the California guideline; and
- Comparing selected provisions of the California guideline and their application with those of other states’ guidelines.

Previous Reviews by the Judicial Council

The 2010 review is the fourth conducted by the Judicial Council.⁸ The previous reviews also examined the most current economic evidence on child-rearing expenditures and analyzed case file data to determine how the guideline was being applied and the extent of deviation from the guideline. The economic evidence examined in these earlier reviews suggested that the California guideline formula resulted in appropriate amounts of child support. The analyses of case file data in these earlier reviews found that the guideline was, in general, being applied and that few orders deviated from the guideline.

Previous Recommendations

Prior reviews have been instrumental in helping to effect changes in the statewide uniform guideline. Specifically, the most recent review, conducted in 2005, suggested continued monitoring and refinement of certain adjustments, deductions, and additional support but no changes to the basic guideline formula. The 2005 review also included the following recommendations and conclusions:

- Research the impact of support orders among low-income families in concert with efforts by the courts, DCSS, and other state entities to assist low-income families;
- Increase or index the income threshold for applying the low-income adjustment;
- Use a calculation similar to that used for child-care expenses for the child's share of the health insurance premium;
- Clarify the hardship deduction (i.e., clarify guideline criteria to yield more consistent application); and
- Encourage better and more detailed information in the case file.

Significant Guideline Changes in the Last Decade

The Legislature has not made any major changes to the guideline since the 2005 review. The most recent significant changes affecting the guideline concerned changes to the low-income adjustment and presumption of income. In August 2003, the Legislature changed the low-income adjustment provision to make a rebuttable presumption that any obligor qualifying for the low-income adjustment should be granted the low-income adjustment (set out in Fam. Code, § 4055(b)(7) at net income below \$1,000 per month). Previously, the court had to justify granting the low-income adjustment by indicating in writing or on the record the reason for granting the adjustment. In August 2004, the Legislature changed the provision regarding the presumption of income (set out in Fam. Code, § 17400(d)(2)) to set presumed income at 40 hours per week at minimum wage.

Organization of This Report

The remainder of this report consists of six chapters. The main purpose of Chapter 2, "Basis of Child Support Guidelines and Studies on Child-Rearing Expenditures," is to analyze the most

⁸ See *supra* note 3.

current economic evidence on the costs of child rearing. The chapter relates the economic evidence to the principles underlying state guidelines.

Chapter 3, “Guideline Application and Deviation: A Review of the Case Files,” presents findings from the analysis of case file data. The purpose of the analysis is to examine how the guideline is applied by judicial officers around the state and to identify reasons that judicial officers may enter order amounts different from those based on the guideline. The chapter presents statistics on the frequency with which child support orders deviate from the guideline, the application of permissible adjustments to income, and other case and order characteristics.

Chapter 4, “Low-Income Parents and Child Support Guidelines,” discusses the impact of child support on low-income parents. It compares California’s computation of support awards for low-income parents to those of other state guidelines.

Chapter 5, “Medical Support Provisions,” analyzes the application of the medical support provisions that affect orders to provide health insurance for the child and the child’s uninsured medical expenses. The provisions include quantitative thresholds for determining whether medical support is reasonable in cost and the ordering of cash medical support. The analyses consider new federal medical support requirements and national health reform and compares California medical support provisions to those of other states.

Chapter 6, “Input From Stakeholders,” summarizes stakeholders’ perspectives of the guideline and recommendations for improving it. The stakeholders include a broad cross-section of groups involved in child support as identified in Family Code section 4054(f).

Chapter 7 presents conclusions and recommendations resulting from the 2010 review process.

This report is circulated for public comment from November 30, 2010 through January 28, 2011.

CHAPTER 2

Basis of Child Support Guidelines and Studies of Child-Rearing Expenditures

Most state guidelines, including California's, currently base their guideline formulas or schedules on measurements of child-rearing expenditures. Federal regulation (45 C.F.R. § 302.56(h)) and state statute (Fam. Code, § 4054(f)) require consideration of economic data on the cost of child rearing in a review of the guideline.⁹ The intent is to ensure that state guidelines reflect current economic data.

The chapter discusses the use of child-rearing expenditures in state guidelines and new measurements of child-rearing expenditures. It assesses the adequacy and appropriateness of the California formula by comparing it to measurements of child-rearing expenditures and other states' guidelines. The discussion focuses on child-rearing expenditures in intact families because they form the basis of most state guidelines, but it also considers child-rearing expenditures in single-parent families and alternative cost estimates. In addition, the chapter discusses additional considerations and assumptions necessary to transform measurements of child-rearing expenditures into a workable guideline formula or schedule. It also provides an overview of alternatives to the principle that a state guideline should be based on measurements of child-rearing expenditures.

Child-Rearing Expenditures and State Guidelines

Most state guidelines are based on a "continuity-of-expenditures model"—that is, the child support award should allow the children to benefit from the same level of expenditures that would have been provided had the children and both parents lived together.¹⁰ The practical result of this approach is that the guideline formulas are based on measurements of child-rearing expenditures in intact families. State guidelines based on this model apply it equally to children of divorce and children of unmarried parents, regardless of whether the parents ever lived together, because most states believe that children should not be the economic victims of their parents' decisions to live apart.

California identifies its guideline model as a specific type of continuity-of-expenditures model called "income shares." Thirty-seven states rely on the income shares model. The core difference between income shares guidelines and other continuity-of-expenditures guidelines is that the

⁹ The requirement states the "cost" of child rearing, but most states rely on measurements of expenditures because costs do not necessarily increase with income, particularly the cost of a child's minimum basic needs. The policy decision underlying all state guidelines is that the support award should be larger the more income the obligated parent has.

¹⁰ Ingrid Rothe & Lawrence Berger, "Estimating the Costs of Children: Theoretical Considerations Related to Transitions to Adulthood and the Valuation of Parental Time for Developing Child Support Guidelines," *IRP Working Paper* (Univ. of Wisconsin Inst. for Research on Poverty, Apr. 2007).

income shares guidelines consider both parents' incomes in the calculation of support, whereas other continuity-of-expenditures guidelines (e.g., Wisconsin's) consider only the obligor's income.¹¹ As explained in the 1993 review of the California guideline,

The California Guideline uses what is commonly called an "income shares" approach to the determination of child support. At its simplest, income shares means that the amount of money allocated to children in a guideline is based on a share of the income of both parents.

(Judicial Council of Cal., *Review of Statewide Uniform Child Support Guideline* (Dec.1993), p. 26.)

The premise of the income shares model is that the child is entitled to the same amount of expenditures as would have been allocated had the child and parents lived as an intact family and that each parent is responsible for his or her pro rata share of those expenditures. It clearly lays the foundation for basing the income shares guidelines on measurements of child-rearing expenditures in intact families.

All measurements of child-rearing expenditures underlying state guidelines are estimates and are derived from national surveys of family expenditures. Economists cannot precisely measure actual child-rearing expenditures because many items are jointly consumed by parents and children (e.g., electricity for the home). This limitation is overcome through estimation methodologies. Differences in methodologies, however, produce a range of estimates of child-rearing expenditures. A 1990 report commissioned by the U.S. Department of Health and Human Services recommends gauging the adequacy of a state's guideline amounts by comparing them to the lower bound of estimates of child-rearing expenditures.¹² State guideline amounts above the lower bound are adequate. The same study also compares state guidelines to the upper bound of the estimates of child-rearing expenditures. Any guideline amount between the lower and upper amount is deemed to be an appropriate amount. The study's approach set the precedent for how California and other states determine the adequacy and appropriateness of their state guideline.

Findings From Last Review

During the last review of the California guideline, the California formula percentages were compared to current measurements of child-rearing expenditures as well as older measurements that form the basis of other state guidelines and the California guideline. The last review found that the California formula generally fell within the range of estimates of child-rearing expenditures but at the higher end of the range. This finding is congruent with one of the legislated principles of the California guideline (Fam. Code, § 4053(1)), which identifies California's higher cost of living as a reason that the California guideline may be higher than other state guidelines.

¹¹ *Ibid.*

Comparisons for the 2010 Guideline Review

This review compares the California guideline to current measurements of child-rearing expenditures, as well as to older measurements that form the basis of current state guidelines. Five older studies form the basis of current state guidelines. They include measurements of child-rearing expenditures developed by:

- Dr. Jacques van der Gaag, an economist with the University of Wisconsin Institute for Research on Poverty, for the state of Wisconsin in 1981;¹³
- Dr. Thomas Espenshade, an Urban Institute economist, through a U.S. Department of Health and Human Services grant in 1984;¹⁴
- Professor David Betson, University of Notre Dame, through the University of Wisconsin Institute for Research on Poverty, for the U.S. Department of Health and Human Services in 1990;¹⁵ and
- Dr. Mark Lino, an economist with the U.S. Department of Agriculture in 2002;¹⁶ and
- Professor David Betson, University of Notre Dame, in part for the states of California and Michigan.¹⁷

Three new studies of child-rearing expenditures have been conducted since California last reviewed its guideline. They include measurements of child-rearing expenditures developed by:

- Professor David Betson, University of Notre Dame, for the state of Oregon in 2006;¹⁸
- Professors Thomas McCaleb, David Macpherson, and Stefan Norrbin, Florida State University, for the state of Florida in 2008;¹⁹ and
- Dr. Mark Lino, an economist with the U.S. Department of Agriculture (USDA) in 2009.²⁰

A fourth study, as discussed in Appendix A and in greater detail below, was also conducted for this review. It consists of new Rothbarth measurements, which are considered the lower bound of child-rearing expenditures, based on data from families surveyed in 2004 through 2009. The purpose of updating the Rothbarth measurements is to include data since the current economic

recession began in December 2007. An updated estimate at the low end of the range is more salient because families may spend even less because of the economic recession.

The most recent USDA study that reflects child-rearing expenditures in 2008, which is a recessionary year, serves as the upper bound.²¹ Although the Florida study produced Engel estimates from families surveyed in 2004 through 2006 that were used to develop an updated schedule for Florida, the study did not publish the point estimates, and the Florida Legislature did not update the schedule.

Most of these studies measure the percentage of total family expenditures devoted to child-rearing expenditures. Economists generally equate family expenditures with after-tax income at low and middle incomes because families at these levels generally spend all their after-tax income and save little. The studies find that the percentage of total family expenditures devoted to one child ranges from 24 to 27 percent. Exhibit 2-1 compares these estimates to the California *K*-fraction for one child at low to middle incomes (\$801 to \$6,661 per month). The California *K*-fraction is 25 percent. The architects of the California guideline formula intended this amount to reflect the percentage of income devoted to child-rearing expenditures and therefore considered the Espenshade and van der Gaag studies when deriving this amount.

As evident in Exhibit 2-1, 25 percent is within the range of current estimates of child-rearing expenditures and those that form the basis of state guidelines. The range is 24 to 27 percent. A caveat to this finding is that these measurements are not identically comparable to the California *K*-fraction. These measurements include expenditures on work-related child care and the child’s uninsured health-care expenses, which are additions to base support according to the California guideline. Excluding these expenses from the estimates of child-rearing expenditures would drop the percentages by a negligible amount to about 6 percentage points, so possibly as low as 18 percent of total expenditures is devoted to basic child-rearing expenditures (i.e., all child-rearing expenditures except child-care and uninsured health-care expenses for the children). This would

²¹ Traditionally, estimates based on the Engel methodology have been used as the upper bound, but the Engel estimator has fallen out of favor both at a practical level and for theoretical reasons. At a practical level, no state has updated its guideline using new Engel estimates. The theoretical issues are discussed in Appendix A.

place the California *K*-fraction of 25 percent above some of the estimates.²² One of the underlying principles of the guideline (Fam. Code, § 4053(1)), however, recognizes that California's guidelines should be higher than those of other states because of California's relatively high cost of living. Indeed, in a comparison of state guidelines calculated for Florida's 2009 guideline review, California's guidelines consistently ranked as one of the highest.²³ In the six scenarios considered in the Florida guideline study, California ranked first, second (twice), third, fifth, and sixth highest.²⁴

Exhibits 2-2 and 2-3 compare the California guideline multipliers for two and three children to the measurements of child-rearing expenditures. Since the measurements of child-rearing expenditures for two and three children are not expressed as multipliers, they are converted to comparable amounts. The ratio of the estimated percentage of total expenditures devoted to two children to the estimated percentage of total expenditures devoted for one child is used to convert a particular measurement of child-rearing expenditures to a multiplier for two children. A similar conversion is made for three children. Multipliers for four or more children are not computed because most of the studies did not measure child-rearing expenditures for larger families. There are too few large families in the Consumers Expenditures Survey (CE), which is the predominant data source used to measure child-rearing expenditures.

Exhibit 2-2 shows that the California guideline multiplier for two children, which is 1.6, is within the range of estimates for child-rearing expenditures. The estimated range varies from 1.4 to 1.7 for two children. Exhibit 2-2 shows the California guideline multiplier for three children, which is 2.0, is at the upper end of the range, which varies from 1.6 to 2.0 for three children.

²² The USDA measurements show that 24 percent of total expenditures are devoted to child care and health care (Lino & Carlson, *supra* note 20, at p. 11), including the out-of-pocket cost of the child's insurance premium. Using this percentage to reduce the 2009 USDA measurement would suggest that 21 percent of total expenditures are devoted to child-rearing expenditures when there is one child. A limitation to this is that it overstates the amount comparable to the California *K*-fraction if the intent of the *K*-fraction is to include the parent's cost of the child's insurance premium.

²³ McCaleb et al., *supra* note 19, at pp. 11–16.

²⁴ The Florida study did not identify the underlying case circumstances of each scenario (e.g., number of children and parents' incomes) other than they represented typical Florida cases and comprised a low-income IV-D case, a middle-income IV-D case, a high-income IV-D case, a low-income non-IV-D case, a middle-income non-IV-D case, and a high-income non-IV-D case.

Exhibits 2-2 and 2-3 illustrate just one way to compare the two- and three-child multipliers from the California guideline formula to measurements of child-rearing expenditures. As discussed above, the estimates of child-rearing expenditures were converted for comparative purposes in Exhibits 2-2 and 2-3 to multipliers similar to those in the California guideline formula. Another comparison method is to calculate pseudo-*K* values for two and three children and compare them to the estimated percentages of total expenditures devoted to two and three children. For example, the pseudo-*K* value for two children would be 0.40, which is 1.4 multiplied by the *K*-value for one child (0.25) for combined net incomes between \$800 and \$6,666 net per month.

Exhibits 2-4 and 2-5 provide these alternative comparisons. (They are similar to the comparisons presented in Exhibit 2-1.) Exhibit 2-4 compares the pseudo-*K* value for two children to the estimated percentage of total expenditures devoted to two children. Exhibit 2-5 shows a similar comparison for three children. Exhibit 2-4 shows that the guideline is within the range of estimated expenditures for two children but at the higher end of the range. Exhibit 2-5 shows a similar comparison for three children. Only one estimate for three children (i.e., the van der Gaag amount) is above the pseudo-*K* value for three children under the California guideline.

Based on the findings from the case file review that is reported in the next chapter, 65 percent of the cases cover one child, 26 percent of the cases cover two children, 7 percent of the cases cover three children, and 2 percent of the cases cover four or more children.

Detailed Summaries of the Economic Evidence

There are three different methodologies for measuring child-rearing expenditures that generally underlie state guidelines: the Engel estimator, the Rothbarth estimator, and the USDA approach. (Engel and Rothbarth are the economists who developed the estimators.) A 1990 report conducted for DHHS concluded that the Rothbarth estimates understate actual child-rearing expenditures and that the Engel and USDA methodologies overstate actual child-rearing expenditures.²⁵ The Engel and Rothbarth estimators are classified as marginal cost approaches because they both compare expenditures between two equally well off families: (1) a married couple with children, and (2) a married couple of child-rearing age without children. The difference in expenditures between these two families is attributed to child-rearing expenditures. To determine whether families were equally well off, the Engel methodology relies on food shares, and the Rothbarth methodology relies on expenditures for adult goods (specifically, adult clothes in the Rothbarth estimates that form the basis of state guidelines). The USDA measures actual child-rearing expenditures for two expenditure categories (i.e., clothing and the combined amount for child care and education) and adds those expenses to estimates of child-rearing expenditures for five expenditure categories (i.e., housing, food, transportation, health care, and miscellaneous expenses). The methodologies for measuring the expense of individual categories vary. Until 2008, the USDA measured the child's housing expenses based on a per capita calculation, assigning each household member an equal proportion of the total housing expenses. The USDA now uses the cost of an additional bedroom to estimate the child's housing expenses.

With the exception of the estimates produced by van der Gaag, all of the estimates of child-rearing expenditures were measured from the CE, which is conducted by the U.S. Bureau of Labor Statistics.²⁶ Beginning in 1980, the CE became an ongoing national survey of households regarding their expenditures. It consists of two components: an interview survey and a diary survey. Most economists use data collected from the interview survey to measure child-rearing expenditures. The CE tracks households participating in the interview survey for five consecutive quarters, with households rotating in and out each quarter. At any point of time more than 7,000 households participate in the interview survey. The CE considers expenditures on hundreds of items, making it the most comprehensive and detailed survey of expenditures available. The CE sampling design consists of a nationally representative sample and samples representative of the four major geographical regions of the country (i.e., the South, Northeast, Midwest, and West). The sampling design is not intended to capture representation of individual states.

A short summary of each estimate and its use in state guidelines follows. The summaries start with the oldest estimate (in part because it is the economic basis of the existing California formula) and end with the most recent estimate. More detail about the older estimates can be found in the 2005 guideline review report.²⁷ More information about the most current estimates (i.e., USDA (2008) and Betson (2010)) can be found in Appendix A.

²⁵ Lewin-ICF, *supra* note 12.

²⁶ Detailed information about the CE can be found at the Bureau of Labor Statistics Web site at www.bls.gov/CE.

²⁷ Judicial Council of Cal., *Review of the Statewide Uniform Child Support Guideline 2005* (Mar. 2006), pp. 71–101.

van der Gaag (1981). Although published in 1981, these estimates still form the basis of several state guidelines, including those of California, New York, and Wisconsin.²⁸ Through the University of Wisconsin Institute for Research on Poverty, van der Gaag conducted a literature review of estimates of child-rearing expenditures available at the time. He found no consensus on the exact value of the cost of a child from the literature. To narrow the range, however, he determined that the true cost of one child was between 20 and 30 percent of a childless couple's net income and so suggested that 25 percent was an obvious point estimate.²⁹ He also estimated that the second child costs about half as much as the first child and that the third child costs about the same as the second child.³⁰ Nine of the 11 studies that van der Gaag reviewed found that the percentage of family income devoted to child-rearing expenditures decreases as income increases.³¹

Espenshade (1984). The Espenshade estimates form the basis of the prototype income shares guideline developed through the 1984–1987 National Child Support Guidelines Project.³² They still form the basis of about eight state guidelines and were considered in the development of the current California guideline. Conducted through a DHHS grant, the Espenshade study used the Engel methodology to estimate child-rearing expenditures from the 1972–1973 CE. Espenshade did not provide point estimates of child-rearing expenditures as a percentage of income or total family expenditures in his study, but other researchers have calculated them from Espenshade's research. They find that the percentage of total family expenditures devoted to child rearing are 24 percent for one child and 41 percent for two children.³³ What Espenshade actually reported is a range of child-rearing expenditures for two-child families by socioeconomic class and other household characteristics.³⁴

Betson (1990). Most states that updated their guidelines in the 1990s relied on Betson's estimates developed from the 1980–1986 CE using the Rothbarth estimator. Five states still base their guidelines on the 1990 Betson-Rothbarth estimates. Commissioned to fulfill a congressional mandate aimed at providing states with information that could be used to develop a statewide guideline, the Betson study actually used five different methodologies to measure child-rearing expenditures for this study. Betson concluded that the Rothbarth estimator was the most robust and therefore recommended its use for state guidelines. The 1990 Betson-Rothbarth estimates indicate that the percentages of family expenditures devoted to child rearing are 25 percent for one child, 35 percent for two children, and 40 percent for three children.³⁵

²⁸ The use of van der Gaag's estimates in California is obvious because the use matches the *K*-fraction. It is less obvious in New York and Wisconsin because those states factored in additional considerations.

USDA (Lino 2002). The USDA releases new measurements of child-rearing expenditures annually. The 2002 USDA study forms the economic basis of the Minnesota guideline. Its estimates reflect child-rearing expenditures in 2001 but are based on the 1990–1992 CE.³⁶ No other state bases its guideline on the USDA estimates (from any study year); however, the recommendation ensuing from the last two reviews of the Ohio guideline was for a USDA-based schedule. It failed to be legislated. The USDA estimates indicate that the percentages of family expenditures devoted to child rearing in 2001 are 26 percent for one child, 42 percent for two children, and 48 percent for three children.³⁷

Betson (2002). Betson updated his Engel and Rothbarth estimates in 2002 using more recent CE data (i.e., 1996–1998 CE). Eleven states still base their guidelines on the 2002 Betson-Rothbarth estimates. Georgia bases its guideline on the average of the 2002 Engel and Rothbarth estimates produced by Betson. The 2002 Betson-Rothbarth estimates indicate that the percentages of family expenditures devoted to child rearing are 25 percent for one child, 35 percent for two children, and 41 percent for three children.³⁸

Betson (2006). Oregon commissioned a study in which Betson updated his Rothbarth estimates in 2006, this time using 1998–2003 CE data.³⁹ These estimates form the bases of 10 state guidelines. The 2006 Betson-Rothbarth estimates indicate that the percentages of family expenditures devoted to child rearing are 25 percent for one child, 37 percent for two children, and 44 percent for three children.⁴⁰

McCaleb et al. (2008). To develop an updated schedule for consideration by the Florida Legislature, McCaleb et al. applied the Engel methodology to the 2004–2006 CE. Although they do not report their average estimates, they do report that their estimates are considerably lower than those of Espenshade and Betson.⁴¹ Their report includes an appendix that partially explains why their results may be lower. The appendix, written by Paula Arce-Trigatti, summarizes her graduate thesis, which investigated the sensitivity of estimates of child-rearing expenditures to the specification of the estimation equation, the choice of variables included in the estimation equation, and the data series used in the estimation.⁴² In the course of her analysis, Arce-Trigatti estimated child-rearing expenditures by applying the Engel and Rothbarth methodologies to 1999–2001 CE data and made slight variations to the sample selection and estimation equation. Although her estimates are not used to develop the proposed Florida schedule, they are reported in the most recent USDA report.⁴³ As of March 2010, Florida had not updated its schedule, and

³⁶ More information about how the USDA measurements were used and adjusted to develop the Minnesota guideline is provided in Jane Venohr & Policy Studies, Inc., *Evaluation of the New (2007) Minnesota Child Support Guideline Basic Support Schedule* (State of Minnesota, Dec. 2005).

⁴³ Lino, *supra* note 20, at p. 19.

none of the estimates of child-rearing expenditures in this report form the basis of any state guideline.

USDA (Lino 2009). The 2009 USDA report, which measures child-rearing expenditures in 2008, makes several changes to the USDA measurements. The 2009 USDA study updates its underlying estimates to those calculated from the 2005–2006 CE. In addition, as discussed earlier, it changed its methodology for determining the child’s housing costs. The 2008 USDA estimates indicate that the percentages of family expenditures devoted to child rearing are 27 percent for one child, 40 percent for two children, and 47 percent for three children.⁴⁴

Betson (2010). For the purpose of this study—to determine the adequacy of the current California guideline formula— Betson updated his Rothbarth estimates to include more current CE data, from 2004 through 2009. Because the Rothbarth estimator is known to understate actual child-rearing expenditures, the Betson-Rothbarth estimates have been used historically to assess whether a state guideline is inadequate. (State guideline amounts below the Betson-Rothbarth estimates are considered inadequate.) Although Betson updated his Rothbarth estimates after California last reviewed its guideline, the estimates did not consider the current recession that began in December 2007, which marked changes to family income and expenditures. The most recent Betson-Rothbarth estimates indicate that the percentages of family expenditures devoted to child rearing are 24 percent for one child, 37 percent for two children, and 45 percent for three children. A detailed technical report of Betson’s most recent findings is provided in Appendix A.

Limitations of the Estimates. No estimate is free of methodological issues or data limitations. As discussed in more detail in Appendix A as well as in most of the other studies,⁴⁵ each estimation technique has its own set of shortcomings. Until recently, the major limitation of the USDA was the per capita calculation of the child’s share of total family housing costs. A major limitation of the Rothbarth estimator is that the CE definition of adult clothing actually captures clothing purchases for older children as well. Although Betson makes some data adjustments to correct for this, the household budget share devoted to adult clothing is critical because it is used as a proxy to identify whether households with and without children are equally well off. As discussed in detail in Appendix A-7, the Engel methodology essentially works (and functions as the upper bound of the range of child-rearing estimates) only when food composes the largest share of family expenditures. In actuality, however, housing constitutes the largest share of family expenditures.

Other Limitations of the Estimates. Other limitations exist because of variable definitions, the functional form of the estimating equations, and the criteria used for excluding cases from the analysis. Appendix A discusses major limitations and includes additional analysis to test the sensitivity of some of the assumptions used in the estimation. One of the major data issues is whether to use “expenditures” or “outlays.” Based on the definition in Appendix A, “outlays” include expenditures plus principal payments on debt including home mortgage principal. The

⁴⁴ Lino & Carlson, 2009, *supra* note 20, at p. 19.

⁴⁵ Lewin-ICF, *supra* note 12; Betson, *supra* note 15; Lino, 2009, *supra* note 20; McCaleb et al., *supra* note 19.

most recent Betson-Rothbarth and USDA measurements include payments on home mortgage principal, but earlier estimates did not. Both the Florida study and Appendix A consider alternative criteria for excluding cases from the analysis. In all, Betson reports that the assumptions he made in developing the latest Betson-Rothbarth estimates would tend to bias them downward (see Appendix A). This has consequences to the use of the Betson-Rothbarth estimates to assess the adequacy of state guidelines. Specifically, when a state guideline is below the Betson-Rothbarth estimates, the hypothesis that the state guideline is inadequate is appropriately accepted; however, when a state guideline is above the Betson-Rothbarth estimates, the hypothesis that the state guideline is inadequate could be inappropriately accepted.⁴⁶

Additional Assumptions and Considerations

The measurements of child-rearing expenditures are just a starting point for developing a state guideline. Many other assumptions and factors are considered in deriving a workable guideline formula or schedule. This includes adjusting the measurements for four or more children, setting guideline amounts for upper incomes, and determining whether to use a gross- or net-income-based guideline. Some states may also adjust the measurements of child-rearing expenditures upward or downward depending on whether the state's cost of living is higher or lower than the national average. States also update measurements of child-rearing expenditures to current price levels when using them to develop a state guideline. States vary in the additional assumptions and considerations that they use to craft their guideline formulas and schedules. These different assumptions and considerations produce just as much variation in state guideline amounts as a state's choice of which measurement to use as the basis of its guideline formula or schedule.

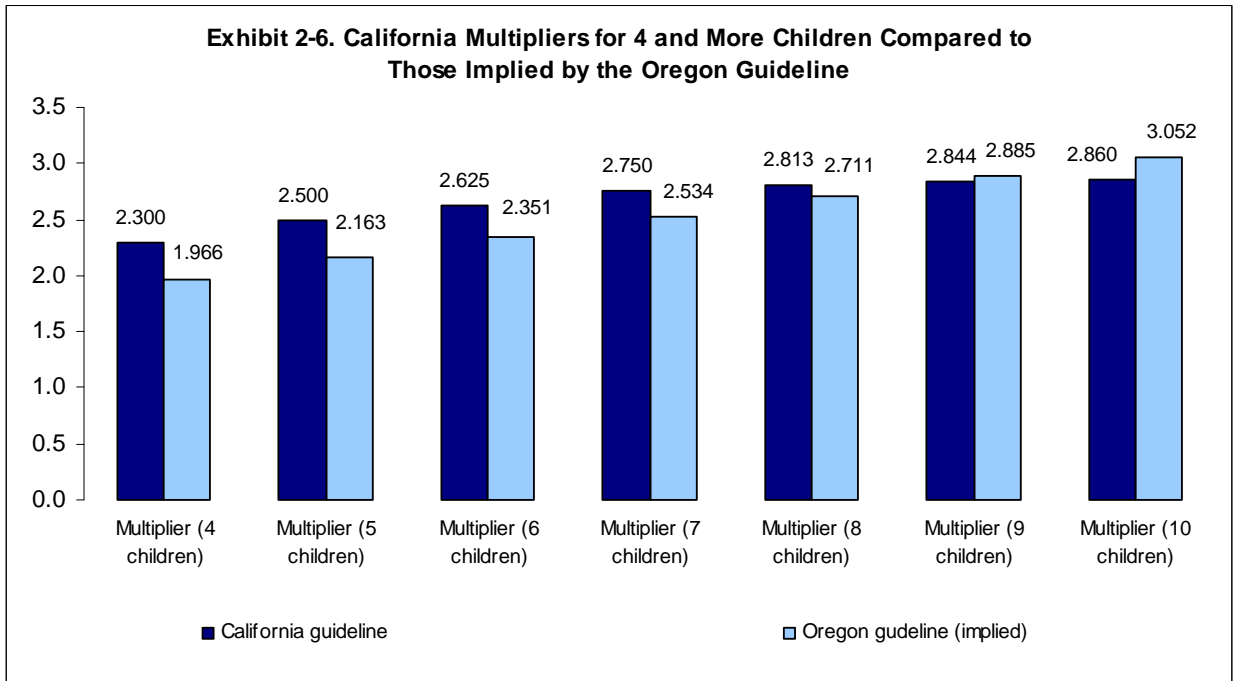

Guideline Amounts for 4 or More Children

As discussed above, economists do not estimate child-rearing expenditures for larger families. Instead, many states rely on an equivalence scale developed by the National Research Council (NRC) to extend the measurements of child-rearing expenditures to 4 or more children.⁴⁷ Exhibit 2-6 compares the California guideline multipliers for 4 and more children to those computed from an Oregon report that relied on the NRC multiplier.⁴⁸ It shows that California multipliers are more than the implicit Oregon multipliers for 4, 5, 6, 7, and 8 children. For 9 children, they are about equal, and for 10 children, the implicit Oregon multiplier exceeds the California multiplier.

⁴⁶ In other words, this analysis lends itself to Type II errors.

⁴⁷ Constance F. Citro & Robert T. Michael, *Measuring Poverty: A New Approach* (Nat. Academy Press, 1995).

⁴⁸ Policy Studies Inc., *State of Oregon Child Support Guidelines Review: Updated Obligation Scales and Other Considerations* (Oregon Dept. of J., May 2006), p. II-7.

Guideline Amounts for Higher Incomes

The percentage of income devoted to child-rearing expenditures arguably decreases as income increases.⁴⁹ This is evident from the *K*-fraction in the California guideline. The *K*-fraction is 0.25 for one child when the combined net income of the parents is \$800 to \$6,666 per month but gradually decreases for incomes above \$6,666 per month to about 0.12 at very high incomes. The architects of the California guideline intended for the *K*-fraction to reflect the percentage of income devoted to child-rearing expenditures for one child and assumed that the percentage of income devoted to child-rearing expenditures decreased as income increased.

To gauge whether the California guideline decreases at an appropriate rate, support awards under the California guideline are compared to those of Minnesota and Oregon. Minnesota bases its guideline on the 2002 USDA measurements of child-rearing expenditures. Oregon bases its guideline on the 2006 Betson-Rothbarth measurements of child-rearing expenditures. (As discussed earlier, the USDA estimates form the upper limit of the current range of estimated child-rearing expenditures used in state guidelines, and the Rothbarth estimator forms the lower limit of the range.) The comparison considers six scenarios where the following circumstances are constant: the obligor’s gross income is \$3,000 per month; there is one child; and the parent who is the higher earner has no shared physical responsibility for the child. Obligee income is the only assumption that changes in the six scenarios. The amounts of obligee incomes considered in the different scenarios are zero; \$1,000; \$3,000; \$5,000; \$7,000; and \$9,000 per

⁴⁹ Malcolm L. Smith et al. *2009 New Hampshire Child Support Guidelines Review and Recommendations* (New Hampshire Dept. of Health & Human Services, Mar. 2009), p. ii.

month. If the support awards decrease as obligee income increases, the guideline reflects that child-rearing expenditures as a percentage of income decline as income increases.

Exhibit 2-7 clearly demonstrates this outcome for the Oregon and Minnesota guidelines.⁵⁰ For example, the Oregon guideline amount decreases from \$558 per month when the obligee has no income to \$524 when the obligee’s gross income is \$1,000 per month; and when the obligee’s gross income increases to \$3,000 per month, the guideline amount decreases to \$429 per month. The California guideline amount remains at \$583 per month until the obligee’s income surpasses \$3,000 gross per month. This is because the combined net income of the parents finally pushes the case out of the income bracket where the *K*-fraction is 0.25. In effect, the California guideline formula plateaus when obligor income is constant and the combined income of the parents falls in the range where the *K*-fraction is 0.25. One caveat to this finding should be noted: The case examples assume that the parent with higher earnings has no shared physical responsibility (which, as shown in the findings from the case file review, is a somewhat common scenario, particularly in IV-D cases). When the higher earner has shared physical responsibility, the order amount will not plateau.

⁵⁰ The Minnesota guideline amounts for the two scenarios in which obligee income was the highest were the same. The reason for this anomaly is beyond the research scope of this study. The researchers calculated the Minnesota guideline amounts from the state’s automated guideline calculator.

Income Basis of the Guideline: Gross Versus Net

Even though the measurements of child-rearing expenditures are generally expressed as percentages of total family expenditures, they are used in both net- and gross-income-based state guidelines. Gross-income guidelines include tax assumptions to convert the estimates of child-rearing expenditures to a gross-income basis. This effectively converts gross income to after-tax income. The California guideline (Fam. Code, § 4059) also effectively converts the gross to after-tax income.

The most common tax assumption used in gross-income guidelines is that all income, regardless whether it is earned by the obligor or obligee, is taxed as a single person with no dependents. This assumption tends to produce lower guideline amounts because the effective tax rate is higher when there are no dependents. The District of Columbia, however, made another assumption to convert estimated child-rearing expenditures, which were calculated as percentages of total expenditures, to a gross-income-based schedule. The District of Columbia schedule assumes that all after-tax income is spent (i.e., there are no savings, even at higher incomes) and that the tax situation is that of a married couple whose number of dependents is equivalent to the number of children for whom support is being determined. For example, the one-child amounts under the District of Columbia guideline were converted from the estimated percentage of total expenditures devoted to raising one child to gross income by assuming the tax rate of a married couple with one child. A key difference between the California provision for converting gross to net income and the gross to net income conversion underlying most states is that the California conversion allows for the obligee and obligor to have different tax scenarios (e.g., the obligee could be married and the obligor could be single). In contrast, gross-income guidelines that are based on estimated percentages of total expenditures devoted to child rearing must assume the same tax scenario for both parents in order to achieve a gross-income-based schedule. This nuance is particularly important for parents with subsequent spouses or other children. The current California approach captures tax differences because a subsequent spouse puts the parent in another income tax bracket, while the income standardization approach used by most states with gross-income-based guidelines would not.

Whether a state chooses to base its guideline on gross or net income is a policy decision. One merit of using gross income is that it does not require information about each parent's tax status and the amount of taxes actually paid. Another merit is that the award amount is the same for parents with identical gross incomes and case circumstances, even though one parent itemizes his or her tax deductions because that parent pays mortgage interest and the other parent rents and does not pay mortgage interest. Of course, this assumes that parents with identical gross incomes should be treated similarly. An alternative perspective is that parents with identical net incomes should be treated similarly. Under that perspective, net income would be favored. A merit of using net income is that it better reflects the actual amount of income that the parent has available to support his or her children.

California Housing Costs

Concerns about California's housing costs are multifaceted. Housing costs in California are more than the national average, they vary considerably by county, and they have recently plummeted during the economic recession. According to 2008 data (the most recent U.S. Census data available), median housing costs in California (\$1,410 per month) are almost 50 percent higher than the national median (\$970 per month).⁵¹ Further, the range in California housing costs is illustrated by comparing the median housing costs of San Diego County, which are \$1,510 per month, to those of Fresno County, which are \$989 per month.⁵²

Several other states have a mix of counties that vary in cost of living (e.g., Maryland and New York). This is generally true of any state with both a major city and rural areas. However, the federal requirement is for a "statewide" guideline. To this end, county differences in housing costs cannot be part of the presumptive guideline formula. It could, however, be a consideration for deviating from the guideline in cases where one or both parents' have extremely high or low housing costs.

Adjusting for Shared Physical Responsibility

State guidelines adjustments for shared physical responsibility are mostly based on policy decisions. There is little economic evidence showing how parents share child-rearing expenses in shared physical responsibility cases and no dataset that tracks expenditures of both the mother and the father who live in separate households but have a common child.⁵³ Unlike most state guidelines, California incorporates its adjustment for shared physical responsibility into its base guideline formula. One of the public comments during the last review was that the California formula produces too much of a precipitous adjustment at some levels. In addition, some participants of stakeholders' focus groups believe that shared physical responsibility creates conflict between parents. They suggested that a few more or fewer overnights with the other parent can substantially change the award amount.

To examine this, we compared guideline amounts adjusted by incremental differences in timesharing. Exhibits 2-8 and 2-9 depict changes in the California guideline amount resulting from incremental increases in the number of overnights the child is with the obligor. The guideline amounts start with 20 percent of the child's time with the obligor and then are adjusted in 5 percentage point increments (i.e., increments of about 1.5 more overnights per month). The exhibits also show the amounts under the Arizona and Oregon guidelines, which have shared physical responsibility adjustments that vary considerably from those calculated with the California formula. Exhibit 2-6 compares a case where the parents have equal incomes (i.e., \$3,000 gross per month) and there is one child. Exhibit 2-7 compares a case where there is one

child, the obligor’s gross income is \$3,000 per month, and the obligee’s gross income is \$2,000 per month.

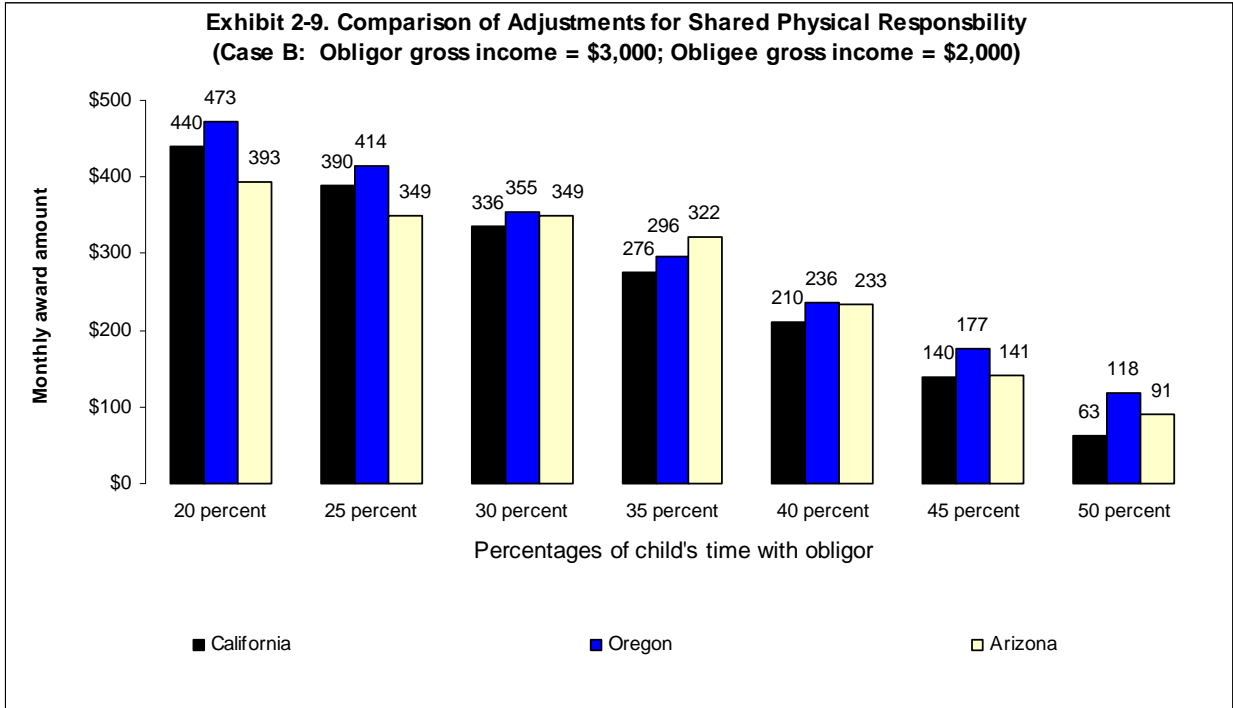

Exhibit 2-8 shows that the support award decreases by about \$40 to \$85 when the child’s time with the obligor increases by 5 percent (i.e., about 1.5 days per month). The \$40 drop occurs when the child’s time with the obligor increases from 45 percent to 50 percent (i.e., the support award dropped from \$40 at 45 percent timesharing to \$0 at 50 percent timesharing). In general, however, the exhibits do not indicate that the California guideline produces any more precipitous drop to the support award than that resulting from the Oregon and Arizona guidelines. They show, however, that the Arizona guideline plateaus when the timesharing arrangement increases from 25 to 30 percent. The Arizona guideline amounts remain the same at these levels of timesharing. The Arizona adjustment is based on a sliding scale that applies to timesharing brackets; timesharing arrangements of 25 and 30 percent are within the same bracket, so the same adjustment applies.

Alternative Measurements of Child-Rearing Costs

A recurring criticism of using measurements of child-rearing expenditures in intact families as the basis of state guidelines is that they do not capture the reality of each parent’s and the children’s current living situation and standard of living.⁵⁴ Although other measurements of child-rearing costs are available, none are used as the basis of any state’s guideline for various reasons.

Expenditures in Single-Parent Families

No state bases its guideline on measurements of child-rearing expenditures in single-parent families. One reason is that an inordinate percentage of single-parent families live in poverty. Nearly 39 percent of California families with a female householder (no husband present) and related children under 18 years of age are below the poverty level.⁵⁵ Most states, including California, believe that the children should share in the standard of living afforded by the parents (see Fam. Code, § 4053(f)). This can be interpreted to mean that if a parent can afford to live above poverty, the children should also live above poverty.

The USDA provides the only recent study to consider child-rearing expenditures in single-parent families.⁵⁶ It finds that child-rearing expenditures in single-parent families generally follow a

⁵⁴ The New Hampshire report provides a summary critique of the literature on this issue (Smith et al., *supra* note 49).

⁵⁵ Calculated from U.S. Census Bur. American Factfinder, “California: B17006. Poverty Status in the Past 12 Months of Related Children Under 18 Years By Family Type,” 2006–2008 American Community Survey 3-Year Estimates, <http://factfinder.census.gov> (as of Mar. 30, 2010).

⁵⁶ Lino & Carlson, *supra* note 20.

similar pattern to those in two-parent families—that is, the amount of dollars expended on children increases as family income rises. The USDA study also compared expenditures in two-parent families and single-parent families. It found that 85 percent of single-parent families and 33 percent of two-parent families were in the lowest income range considered in the USDA study, which consisted of families with incomes below \$56,870 per year in 2008 dollars. On average, child-rearing expenditures were 7 percent lower in single-parent families than in two-parent families. One reason that single-parent families in this income range may spend less is that they have lower average income than two-parent families in this income range.

Foster Care Payments

One participant in the stakeholder focus group suggested that California should base its guideline on child-rearing costs and further suggested that foster care payments may be a source of that information. California foster care rates vary by region, age of the child, care setting, and treatment. In 2008, the basic rates ranged from \$427 to \$635 per child per month.⁵⁷ The underlying source of these rates was beyond the research scope of this study.

Self-Sufficiency Standard

The “self-sufficiency standard” measures how much income working individuals and families need to pay for their basic needs. Developed through a Ford Foundation grant, the self-sufficiency standard is calculated for various states. No state bases its guideline amounts on the self-sufficiency standard, but it still informs state guideline reviews. Published in 2008, California’s most recent self-sufficiency standard shows a large variation in income needs by county, family size, and child age.⁵⁸ For example, a family of two consisting of an adult and a school-age child requires a monthly wage of \$2,481 per month in Siskiyou County and \$3,515 per month in Santa Clara County. When compared to what is required for a single adult, this suggests that a school-aged child costs \$942 per month in Siskiyou County and \$1,162 per month in Santa Clara County.⁵⁹

Alternative Bases of State Guidelines

Some policymakers believe that getting the measurement of child-rearing expenditures right is paramount.⁶⁰ They argue that measurements that fall short put children at risk of poverty or yield guideline amounts that do not appropriately allocate the economic responsibility for the children between the parents. Some also acknowledge that problems inherent in estimation methods and

⁵⁸ Insight Center for Community Economic Development, *How Much Is Enough in Your County* (May 2008).

⁵⁹ This is based on the difference between the self-sufficiency standard for one adult and the self-sufficiency standard for one adult and a school-aged child.

⁶⁰ In fact, the lack of agreement on which measurement was suitable for an update of the Washington guideline was why the committee charged with reviewing the guideline could not recommend how to update it even though it had not been updated for almost 20 years. (State of Washington Joint Legislative Audit & Review Com., *Review of Child Support Guideline: Proposed Final Report* (Jan. 2010).

data make a perfect measurement infeasible.⁶¹ Still others believe that it is better to err on the side of the children and the custodial parent.⁶² These limitations aside, several states simply acknowledge that their guidelines are partially based on economic data and partially based on policy decisions.⁶³ Further, some argue that the current approach to guidelines no longer equitably fits the child support caseload because of greater incidences of joint custody and multiple-partner fertility and an increasing proportion of never-married parents in the IV-D caseload.⁶⁴

In general, state guideline solutions that adjust for low incomes and multiple-partner fertility are not based on measurements of child-rearing expenditures. In addition, if state guidelines were based on standard of living, as some advocate, they would not be based on measurements of child-rearing expenditures. Following is an overview of some of these approaches.

Low Incomes

As discussed in great length in Chapter 4, in some cases both parents may be impoverished and neither parent can afford what it actually costs to raise a child. Most states recognize this issue. Most state guidelines provide some sort of guideline adjustment for obligors with poverty or near-poverty incomes. The guideline amounts at this level often reflect a token amount or an amount that an obligor can reasonably pay while leaving him or her sufficient income to live at least at a sustainable level. As evident in Chapter 4, however, most states have failed to keep their low-income adjustments current.

Multiple-Partner Fertility

Guidelines amounts based on child-rearing expenditures in intact families cannot reflect the reality that mothers or fathers have children with several different partners. The incidence of multiple-partner fertility in California is unknown. A national survey of families and households conducted in 1989 found that 31 percent of noncustodial parents live with a new partner and children, including stepchildren.⁶⁵ One of the most comprehensive and detailed studies of fertility patterns of parents with multiple-partner fertility is a Wisconsin study that tracked cases for four years after the custodial parent applied for public assistance.⁶⁶ It found that more than half of the involved parents—the custodial parent, noncustodial parent, or both—had children with multiple partners.

⁶⁶Maria Cancian, Steven Cook & Daniel R. Meyer, *Child Support in Complicated TANF Families* (Wisconsin Dept. of Workforce Development, 2003).

Wisconsin researchers identified three approaches for dealing with multiple families when setting child support orders.⁶⁷ The approach taken by most state guidelines, including California's, is to consider each case independently. There may be an adjustment to the parent's income for other children living with the parent besides the children for whom support is being determined, but the support award is determined for the children in an individual case and support awards for other children are not revisited simultaneously. Another approach centers on the combined needs of all children living with the obligee. Although no state currently takes this approach, it could ensure an adequate level of support to the children while recognizing the economies of scale of more than one child living with the obligee. A third approach considers the financial resources available to an obligor to support all of his or her children living in different households. This could substantially reduce support in all of the obligor's cases and requires that support be determined for multiple cases simultaneously. Louisiana is the only state to consider such an adjustment, but it failed as legislation.⁶⁸ The Louisiana proposal attempted to treat all of the obligor's children equally while recognizing the other parents' financial responsibilities for their children.⁶⁹ The Louisiana proposal did not consider how much it costs to raise a child in an intact family.

Standard of Living

Those critical of basing state guidelines on measurements of child-rearing expenditures typically advocate state guidelines that consider the noncustodial parent's and the custodial family's standards of living after payment or receipt of child support. However, there is no consensus on the impact of child support on standard of living and what guideline model would yield a more equitable amount. Some argue that the underlying models of most state guidelines generally produce a higher standard of living for the custodial family than that of the noncustodial parent.⁷⁰ Others argue that the only situation in which the custodial family's standard of living is generally higher than that of the noncustodial parent is when the custodial family has more income than the noncustodial parent.⁷¹ Still others argue that the custodial parent's and child's standards of living are inextricably linked, so it is an acceptable policy outcome for the custodial family's standard of living to increase.⁷² California takes this position. It is stated in one of the guideline principles in state statute:

⁷² Massachusetts Trial Cts., *supra* note 62.

Children should share in the standard of living of both parents. Child support may therefore appropriately improve the standard of living of the custodial household to improve the lives of children.

(Fam. Code, § 4053(f).)

The Arizona Judicial Council recently adopted a state guideline that is intended to partially close the gap between the custodial family's and noncustodial parent's standards of living.⁷³ The new guideline was developed in response to criticism over measurements of child-rearing expenditures and Arizona's version of the income shares model.⁷⁴ The new model generally produces award amounts lower than the existing Arizona guideline when the noncustodial parent's income is less than the custodial parent's income, and it produces amounts greater than the existing Arizona guideline when the noncustodial parent's income is higher than the custodial parent's income. It also significantly reduces the amounts for low-income noncustodial parents.

Chapter Summary

Most state guidelines, including California's, are based on the concept that the child support award should allow the children to benefit from the same level of expenditures that would have been provided had the children and both parents lived together. As a consequence, most states base their guidelines on measurements of child-rearing expenditures in intact families.

Several different measurements of child-rearing expenditures underlie state guidelines and are available to update the California guideline formula. The architects of the California guideline intended the *K*-fraction to represent the percentage of income devoted to child-rearing expenditures for 1 child. The *K*-fraction of 25 percent at combined net incomes of \$800 to \$6,666 is within the range of measurements of child-rearing expenditures, but it is on the high side when adjusted for child care and uninsured medical expenses. The California guideline multipliers for 2 and 3 children are within the range of measurements of child-rearing expenditures, but the amount for 3 children is at the extreme high end of the range. The California guideline multipliers for 4, 5, 6, 7, and 8 children are relatively high, while the multiplier for 9 children appears within range. The California guideline multiplier for 10 children is relatively low. The California guideline does not adjust for increases in obligee income until the combined income of the parents exceeds \$6,666 per month or the parents share substantial physical responsibility. The California adjustment for shared physical responsibility decreases when the number of overnights with the obligor increases at a rate comparable to that used in other state guidelines.

⁷⁴ Arizona Judicial Council, *Final Report of the Arizona Child Support Guidelines Review Committee* (Arizona Judicial Council, Mar. 2010).

This chapter also reviews the rationale for basing state guidelines or parts of state guidelines on amounts that do not reflect measurements of child-rearing expenditures. Justification for these alternative approaches may be due to the circumstances of the case and/or underlying guideline principles. For example, most states handle situations where both parents are impoverished by setting the order amount at a token amount rather than the cost of raising a child. Principle-based rationales generally consist of beliefs that the guideline should consider the standard of living of the children or of both the obligor and obligee households after payment or receipt of child support.

CHAPTER 3

Guideline Application and Deviation: A Review of the Case Files

This chapter begins with a summary of the sampling and data collection conducted for this study and then looks at the deviations from the guideline found in the sampled cases. The chapter then ends with a description of the cases included in the case file review. See Appendix B for additional discussion of study methodology.

Sampling and Data Collection

Sampling Time Frame

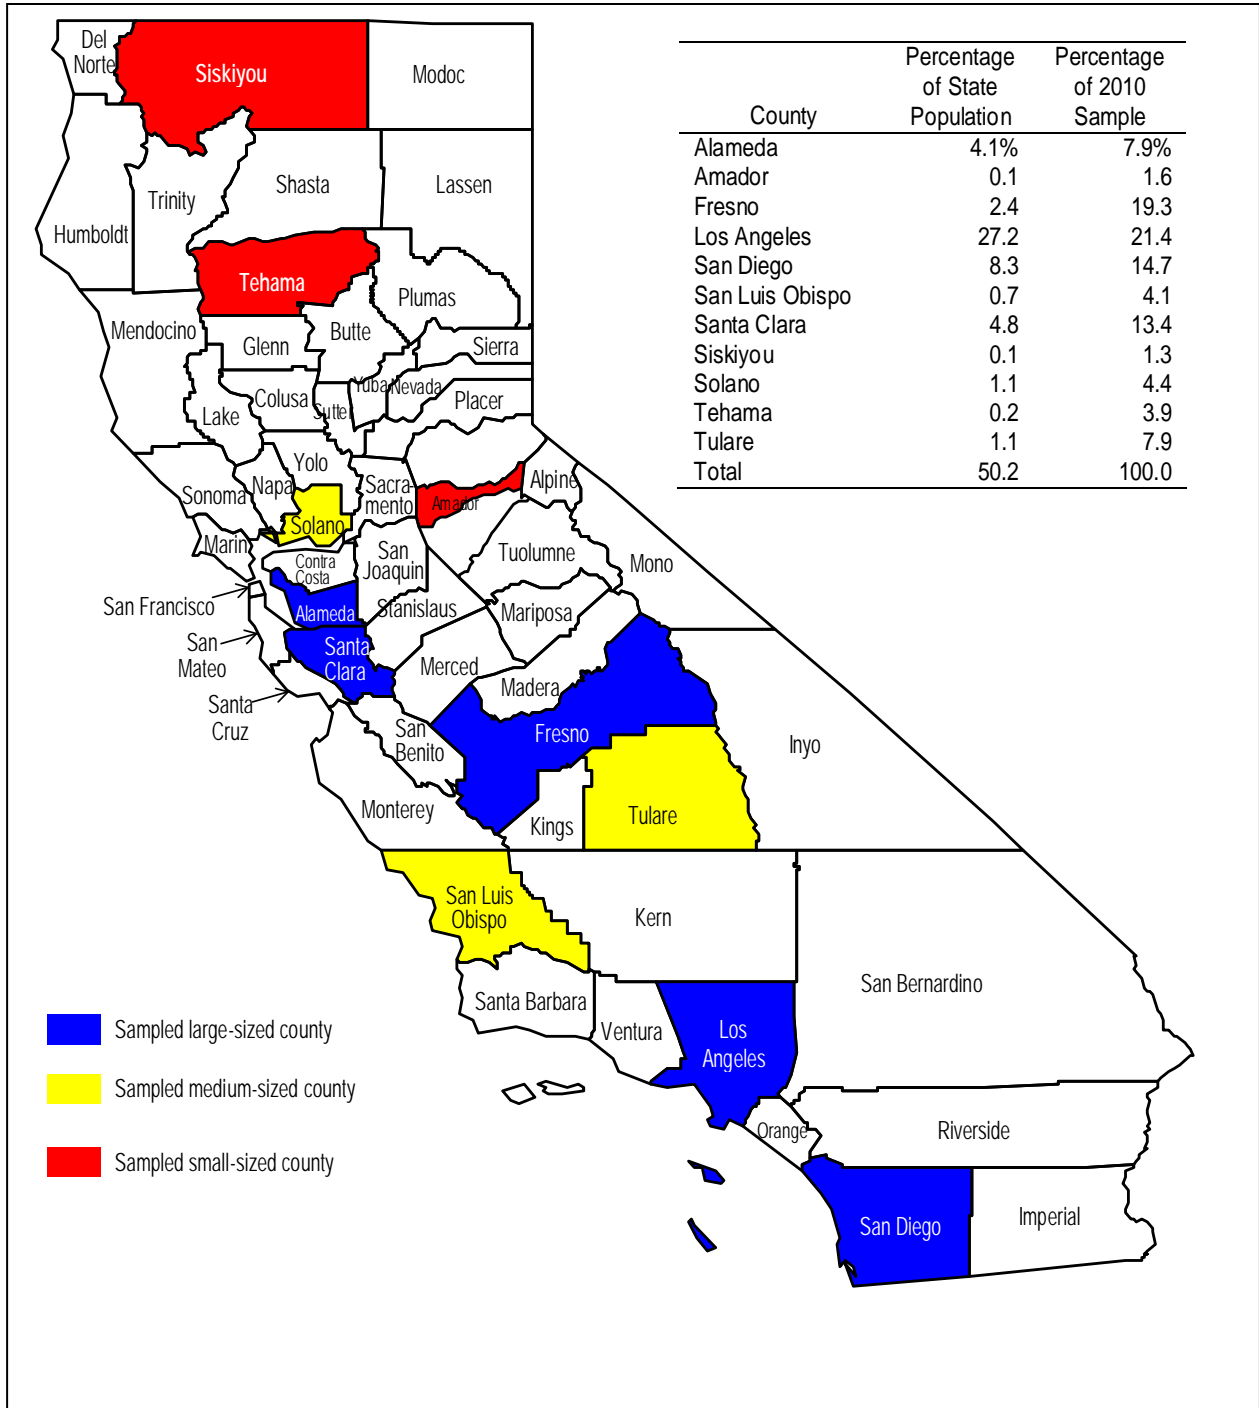

The sampling time frame for the study included cases with filings and orders during the time period January 1 through December 31, 2008. This calendar year allowed a sufficient amount of time for action to occur in a case prior to data collection.

Sampled Counties

A review of individual case files was required for the data collection. As a result, it was not feasible to include all 58 California counties in the review. The 11 selected counties are the same counties that participated in the 2005 study.

As shown in Exhibit 3-1, the five large (blue), three mid-sized (yellow), and three small (red) counties participating in the study account for 50 percent of the state's population and vary in region. More detail on the sampled counties, including population size, economic status, and selected demographic characteristics, are provided in Appendix B.

Exhibit 3-1. Study Counties by Location, Population Size, and Percentage of State Population and Total Sample

Sample Sizes

The minimum, targeted sample size was 1,000 cases. This is adequate to measure deviation rate, changes in deviation rate, and changes in deviation rate by various subgroups. It was also the targeted sample size for the last two guideline reviews.

The sample of 1,000 cases is weighted across the counties to create a proportional representation. Los Angeles County is separated from the very large counties because of its inordinate share of cases, 38 percent of all cases in large counties. Rather than use the 38 percent in a proportional sample, we used 21 percent because Los Angeles accounts for 21 percent of statewide child support order establishments.

For other counties, the cases sampled represent the county's proportion among the other counties of similar size in the state. For example, 55 percent of all establishments occur in large counties. Since Alameda, a large county, consists of 15 percent of establishments among sampled counties, the weight for Alameda County is 8 percent (55 percent multiplied by 15 percent) of all targeted cases.

Given that some cases will have to be excluded because of missing data, the courts were asked to oversample by 20 percent. For example, the minimum sample goal in Los Angeles was 209 cases but with 20 percent added for oversampling, Los Angeles was asked to provide a random sample of 250 cases (i.e., 209 cases plus 41 cases). Across all counties this produced a targeted sample size of 1,199 cases. Counties were instructed to sample equally from IV-D and non-IV-D cases. Previous guideline reviews also considered almost an equal split of IV-D and non-IV-D cases. All cases were randomly selected.

In all but two of the small counties, the cases included in the analysis met or exceeded the weighted sample goal. The two exceptions, Siskiyou and Tehama, fell short by 10 and 7 cases, respectively. By contrast, the sample as a whole exceeded the minimum sample goal by 226 cases. All cases for which data were collected (1,226 cases) were used for analysis. Exhibit 3-2 gives more information about the sampling by county and the number of cases received and included in the analysis.

Exhibit 3-2. Sample Size (Number of Cases)			
	Minimum Sample Goal	Targeted Sample	Cases Usable for Analysis
Large-sized counties			
Los Angeles	209	250	262
Alameda	79	95	97
Fresno	197	236	237
Santa Clara	121	146	164
San Diego	147	177	180
Medium-sized counties			
San Luis Obispo	32	38	51
Solano	44	52	54
Tulare	73	88	97
Small and very small counties			
Amador	17	20	20
Siskiyou	26	31	16
Tehama	55	66	48
Sum of sampled counties	1,000	1,199	1,226

Data Collection Methodology

The data collection instrument (included in Appendix B) is essentially the same instrument used in the two previous guideline studies. The only notable exceptions are some questions targeting medical support process.

Data collectors were recruited through a competitive bidding process. Required qualifications included a law degree, knowledge of California family law, and familiarity with court files. A law degree and family law background are helpful because the documentation of legal proceedings and other information in family law case files can be voluminous. Case files may contain complaints, summonses, notices, documentation of service of process, financial statements, proof of income, orders for support, orders for income withholding, printouts of guideline calculations, and other pertinent information. Administrative Office of the Courts (AOC) staff trained the outside attorneys in how to use this information to complete the data collection instrument. The training was conducted individually. In addition, AOC attorneys collected the data on two counties.

Review of Preliminary Case File Review Findings

After all data were received and entered, the Center for Policy Research (CPR) conducted two focused discussion groups, one with advocates and one with child support commissioners from the counties involved in the case file review. Project staff shared selected preliminary findings

with the two groups to help add context to the statistical data and help interpret the case file review results. When available, the project staff compared data from the 2008 sample to data from the 2004 sample. The advocates and commissioners were asked to explain trends and suggest possible reasons for the findings.

Guideline Deviations

A major purpose for the collection of case file data is to generate a database that allows analysis to accurately determine whether the guideline is being used and how commonly deviations from the guideline occur. Family Code section 4057 states that the amount of child support determined by the guideline formula will be presumed to be the correct amount unless one or more of the following factors are applicable by a preponderance of the evidence:

- (1) The parties have stipulated to a different amount of child support under subdivision (a) of Section 4065.⁷⁵
- (2) The sale of the family residence is deferred pursuant to Chapter 8 (commencing with Section 3800) of Part 1 and the rental value of the family residence in which the children reside exceeds the mortgage payments, homeowners insurance, and property taxes. The amount of any adjustment pursuant to this paragraph shall not be greater than the excess amount.
- (3) The parent being ordered to pay child support has an extraordinarily high income and the amount determined under the formula would exceed the needs of the children.
- (4) A party is not contributing to the needs of the children at a level commensurate with that party's custodial time.
- (5) Application of the formula would be unjust or inappropriate due to special circumstances in the particular case. These special circumstances include, but are not limited to, the following:
 - (A) Cases in which the parents have different time-sharing arrangements for different children.
 - (B) Cases in which both parents have substantially equal time-sharing of the children and one parent has a much lower or higher percentage of income used for housing than the other parent.
 - (C) Cases in which the children have special medical or other needs that could require child support that would be greater than the formula amount.

Exhibit 3-3 shows the percentage of orders deviating from the guidelines in each of the studies conducted in 2010, 2005, 2001, and 1998. In the first three studies—those in 1998, 2001, and 2005—the deviation rate was fairly constant. In each of these years, around 9 to 10 percent of the

⁷⁵ Courts encourage litigants to work out agreements in legal matters, including child support. In assessing the application of the child support guideline, this study focuses primarily on court-ordered deviations, rather than nonguideline child support orders agreed to by the parties. However, even with orders entered by stipulation, the court must find that parents have recited a waiver if the agreed amount is below the guideline formula amount. Among other things, the waiver states that the parties have been informed of the guideline amount, that they agree voluntarily to the amount in the order, and that the needs of the children will be adequately met by the agreed amount (Fam. Code, § 4065). In addition, there are limitations to stipulations in governmental cases.

sampled cases showed a deviation from the guideline. In the 2010 sample, 14.6 percent of the sampled cases show a deviation.

When asked about the deviation rate, the commissioners initially responded that it is lower than what they had expected. The commissioners agreed that, in general, when there is an economic downturn and lower

income, deviations increase. They gave several situations that typically result in a deviation and that they are seeing more frequently:

- Many obligors have very low income, especially given the economic climate in California during 2008. The commissioners stated that if the obligor cannot afford to support himself and live at a subsistence level after the guideline amount is taken out of his income, they will deviate from the guideline. The commissioners find that deviating so that the noncustodial parent can support himself is in the best interest of the child and ensures that the obligor does not have a disincentive to work in the above-ground economy.
- Parents stipulate to a different order amount; and if the conditions of Family Code section 4065(a) are met, commissioners often agree with the stipulated amount.
- When the custodial parent has no income and the noncustodial parent has very low income and shared physical responsibility for the child, the guideline formula ends up penalizing the noncustodial parent for visiting with the child.⁷⁶ The commissioners stated that they will deviate in these cases because making the noncustodial parent pay for shared physical responsibility is unfair.
- Many of the commissioners felt that when parents have extremely high incomes, the result of the guideline formula ends up being extraordinarily high. If these cases end up going to court, which is occurring more frequently because of the economic recession, the court will deviate.
- Obligor often have multiple children with multiple partners. In these cases, if the obligor has zero timesharing with the children on the child support case, the order ends up being so high that the obligor cannot afford to support all of his or her children. The commissioners examine situations like this individually to determine whether it is appropriate to deviate.
- Some commissioners stated that they will deviate in cases where obligor income is presumed because there is no proof that the obligor is actually earning that amount and the child support order ends up being too high.

⁷⁶ The researchers for this study were able to replicate this outcome using obligor income less than \$1,000 net per month.

The advocates felt that the deviation rate may have increased because judges are examining cases individually to determine what parents can afford to pay. Additionally, parents are more educated and know when they may be eligible for a deviation and will request it.

Exhibit 3-4 shows the deviation rate for various types of cases: IV-D status, method of order establishment, new establishments versus modification, and legal representation of the parents.

IV-D Status

Non-IV-D cases were significantly more likely to involve a deviation than were IV-D cases. Just over 20 percent of the non-IV-D cases showed a deviation from the child support guideline, compared to 9 percent of the IV-D cases. Deviations in IV-D orders are probably lower because deviations in CalWORKS cases are limited under Family Code section 4065(c).

Method of Order Establishment

The following three categories were used to classify how an order was entered:

- Default: The respondent/defendant did not file responsive papers and did not appear at the hearing, and there was no written stipulation or stipulation taken on record.
- Contested: The respondent/defendant filed responsive papers or appeared at the hearing, and there was no written stipulation.
- Stipulation: There was a written stipulation or stipulation taken on record.

This classification is consistent with categories used in the last case file reviews and for

other legal matters.⁷⁷

As Exhibit 3-4 shows, deviations from the guideline were most common in stipulated cases. These cases were two to three times as likely to deviate from the guideline as were contested and default cases. When there was a deviation from the guideline, stipulations were also more likely than contested or default orders to be deviations below the guideline. Sixty-four percent of the stipulated deviations were downward, compared to 8 percent and 10 percent of the contested and default orders, respectively.

Newly Established and Modified Orders

Although more modified orders than new orders showed a deviation from the child support guideline, the difference is not statistically significant.

Legal Representation of the Parties

There are no statistically significant differences in the percentages of cases with deviations from the guideline based on legal representation of the parties. When both parents had attorneys, 10 percent of the cases resulted in a deviation. When neither party had an attorney, 15 percent deviated from the guideline. When only the obligor or obligee was represented, the percentages of cases with deviations stood at 13 and 17 percent, respectively.

Some of the patterns presented in Exhibit 3-4 were reexamined using data from both the 2005 and 2010 study to determine whether the types of cases with deviations have changed over time.

Exhibit 3-5 compares selected types of cases on deviation rates in 2005 and 2010. In each type of case there were significantly more deviations in the 2010 sample than in the 2005 sample. The greatest differences were between the 2005 and 2010 non-IV-D cases with deviations and the 2005 and 2010 new-order cases.

⁷⁷ Commissioners from the study counties noted that these definitions and delineations among the categories can be indistinct. Examples given by the commissioners are listed later in the chapter where order entry method is discussed.

Reasons for the Deviations

Exhibit 3-6 shows the reasons for deviations. The total does not add up to 100 percent because some cases had multiple reasons for deviations. As shown in Exhibit 3-6, the percentage of deviations resulting from a stipulation between the parties remained constant from 2005 to 2010. At both time points, about 60 percent of the deviations were by stipulation. The guideline amount was deemed unjust or inappropriate in 4 and 3 percent of deviations, respectively, in 2010 and 2005. Other reasons were noted in 15 percent of the 2005 deviations and 20 percent of the 2010 deviations.

Exhibit 3-6 also shows that the deviation reason was unstated in 22 percent of the 2010 deviations. That rate varied between IV-D and non-IV-D cases. The reason was unstated in 30 percent of the IV-D deviations and 20 percent of the IV-D deviations.

The commissioners were taken aback by the frequency of cases in which the reasons for the deviations were unstated. All commissioners said that, in their rulings, they always state the reason for a deviation. However, they did acknowledge that the oral ruling may not get put into the case file or order. Several commissioners added that they print out the calculation and attach it to the order in all of their cases.

Direction of the Deviations

Exhibit 3-7 compares the direction of the deviations in the 2010 and 2005 reviews. As shown in the exhibit, downward adjustments were made in the majority of deviations in both study years. This means that the amount ordered in the case was less than the amount calculated by the guideline. There is a statistically significant difference between the years in the percentage of deviations adjusted upwardly. In 2005, just over a quarter of deviations were upward, compared with 14 percent in the 2010 review.

The commissioners were surprised that any of the deviations were in an upward direction. In court, they said, it is rare to see parents asking for an upward deviation. Both the commissioners and the advocates agreed that the increase in upward and decrease in downward deviations is undoubtedly related to the economic climate. The advocates added that the increase in downward deviations may be related to the parents' being more educated and knowing when they are eligible for a downward deviation.

**Exhibit 3-7. Deviations From the Guideline in the 2010 and 2005 Reviews
(Percentages of Cases)**

	2010 Review	2005 Review
Percentage of cases with a deviation*	14.6%	9.1%
Of those cases with a deviation, the direction of the deviation:		
Upward*	14	26
Downward	69	60
Unstated	17	14

* The difference between the groups is significant at <.05.

Description of the Cases

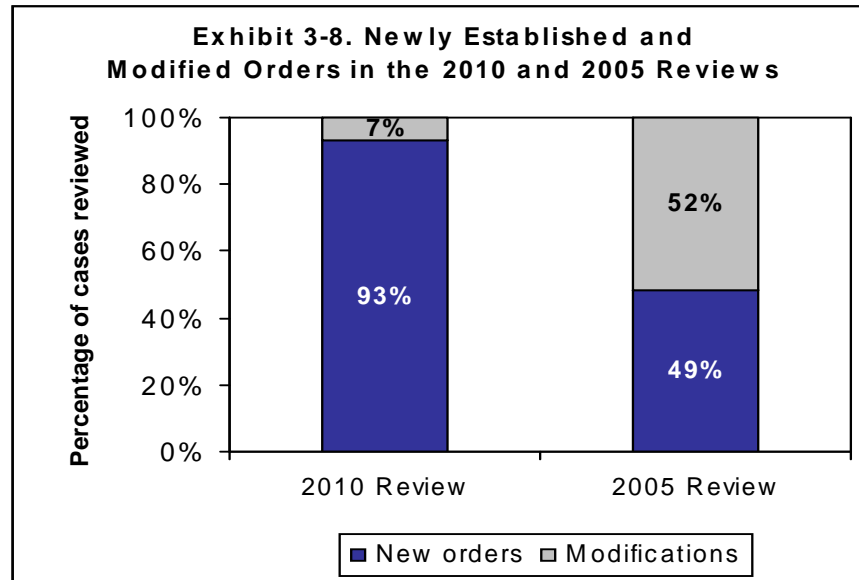

This section describes characteristics of the cases reviewed to put the deviation rate in context. It considers whether the order is newly established or modified and the order entry method.

Newly Established and Modified Orders

As shown in Exhibit 3-8, the vast majority of cases in the 2010 case file review (93 percent) are newly established orders. In the last review, 49 percent of the cases were newly established orders and 52 percent were modifications. Some of this drastic, statistically significant change can be attributed to changes in the sampling methods occurring since the last review. Specifically, the sample for the 2010 review was drawn from filings in calendar year 2008 that also had an order entered in 2008.⁷⁸ The sample for 2005 review was drawn from the court calendar. Another factor that may have contributed to the high percentage of modifications during the previous review is that many IV-D agencies were requesting modifications of orders based on the low-income adjustments that became presumptive with legislative changes in 2003.

⁷⁸ However, this is also the sampling method employed in the 2000 review, with the exception that for the 2000 sample the order did not have to be entered in the same year. That is, the 2000 sample was selected from cases filed within the same calendar year, but an order did not necessarily have to be established during that year. Because the 2000 data collectors were instructed to collect data on the most recent action, this practice allowed some modifications to be included in the sample.

The commissioners and advocates unanimously agreed that the reason for the shift in newly established and modified orders was the different sampling method used in the 2010 review. Having an order filed, established, and modified all in one year is extremely rare.

Order Entry Method

As previously stated, the three categories used to classify how an order was entered were:

- Default: The respondent/defendant did not file responsive papers, did not appear at the hearing, and there was no written stipulation or stipulation taken on record.
- Contested: The respondent/defendant filed responsive papers or appeared at the hearing, and there was no written stipulation.
- Stipulation: There was a written stipulation or stipulation taken on record.

These categories can be indistinct, however. The previous case file review listed several situations involving combinations of more than one of these categories and identified cases in which it was difficult to distinguish among the three categories:

- Hearings are sometimes uncontested. In some cases, respondents appear at court—either because they do not fully understand the pleadings or because they think they are required to appear—but do not contest the facts of the case or the order amount.
- Some hearings combine paternity and order establishment. In these cases, the respondent/defendant may order DNA testing. Some courts offer immediate DNA testing and results. In these courts, it is common for a respondent to agree to the support award once he learns that he is indeed the biological father of the children.
- In some hearings, only one or two facts are contested. Therefore, whether an order is categorized as “contested” may be a matter of degree and may not be equivalent to the level of contest at a different hearing. The last review cited the percentage of time a child spends

with each parent and different types of income (e.g., self-employed, temporary, or seasonal incomes) as the most common issues of dispute.

- Parties may stipulate immediately before a scheduled hearing. In some of the aforementioned cases where parties agree to all but one fact, some commissioners provide a window of opportunity for the parties to stipulate before swearing the parties under oath.
- In some counties, respondents do not need to file responsive papers to schedule a hearing. The respondent instead calls a telephone number to access an automated system to schedule a hearing. Although these cases are categorized as contested since the respondent appears at the hearing, responsive papers are not filed.

As shown in these circumstances, different courts may interpret and use the classifications differently based on the individual characteristics of the case.

Exhibit 3-9 shows the order entry method in the 2010, 2005, and 2001 case file reviews. As shown in the exhibit, the percentage of cases entered through default decreased from 44 percent in 2001 to 29 percent in 2005 and then went back up to 46 percent in the 2010 review. (The changes between the years are both statistically significant.) There were also statistically significant decreases from 2005 to 2010 in the percentages of cases that were stipulations (from 39 percent to 32 percent) and contested (from 32 percent to 23 percent).

Commissioners and advocates attributed the increased default rate to several factors. In 2004, when the last sample was pulled, there was a push to reduce default cases. Since then, however, this effort has stopped, perhaps contributing to the increase in defaults. The commissioners also noted that the DCSS is asking for lower orders in the initial summons. In addition, the commissioners noted that some default orders are actually uncontested orders. When an obligor

receives the proposed judgment and it is an order he or she can live with, the obligor may not follow up with DCSS. The parent does not contact DCSS, and DCSS offices, which have experienced staff cutbacks, may not have the time or resources to follow up with the parent. That being said, the commissioners did find the increase in default judgments problematic. The advocates also believed that the increased defaults may be partially the result of the economic climate and the inability of parties to afford attorney representation.

Exhibit 3-10 shows the order entry method for IV-D and non-IV-D cases in the 2010 case file review. As shown in the exhibit, more than two-thirds of IV-D cases were entered through default, whereas only 22 percent of non-IV-D cases were entered through default. (These both represent increases since the last review, when 45 percent of IV-D and 13 percent of non-IV-D cases were entered through default.) Most (77 percent) of default orders were uncontested. Non-IV-D cases were more likely to be entered through stipulation (47 percent) or contested hearings (31 percent) than IV-D cases, where 18 and 15 percent of cases were entered through stipulation and contested hearings, respectively. All of the differences between IV-D and non-IV-D cases in the 2010 review are statistically significant.

The IV-D default rate (i.e., 68 percent) detected in the case file sample is higher than the default rates tracked by the California Department of Child Support Services (CDSS). In state fiscal years 2008 and 2009, CDSS reported default rates of 48 and 41 percent, respectively.⁷⁹ Part of the reason may be explained by above-average default rates (e.g., over 50 percent) in some of the large counties in the sample, but that is unlikely to explain all of the difference.

	IV-D Cases	Non-IV-D Cases
Default*	68%	22%
Contested*	15%	31%
Stipulations*	18%	47%
Number	628	569

*The difference between the groups is significant at <.05.

Application of Other Guideline Factors

The guideline provides for many adjustments to base support: a hardship deduction, the low-income adjustment, orders for additional support, and health insurance coverage.

Hardship Deductions

Family Code section 4070 allows the court to grant parents a hardship deduction in circumstances listed in section 4071, including:

- Extraordinary health expenses for which the parent is financially responsible;

⁷⁹ Cal. Dept. of Child Support Services, “Comparative Data for Managing Program Performance: Federal Fiscal Year 2009,” table 3.12 (Mar. 2010); Cal. Dept. of Child Support Services, “Comparative Data for Managing Program Performance: Federal Fiscal Year 2008,” table 3.12 (Apr. 2009).

- Uninsured catastrophic losses; and
- Additional children from subsequent or prior relationships living with the parent whom the parent has an obligation to support.

In the 2010 review, the case files noted a hardship deduction for 4 percent of fathers and 4 percent of mothers. As shown in Exhibit 3-11, the percentage of cases in which a hardship deduction was applied decreased between the 2005 and 2010 reviews, down from 11 percent for fathers and 6 percent for mothers in the 2005 review. Both of these decreases are statistically significant. Additional children was the reason for most hardship deductions. Additional children was the reason for 78 percent of the hardship deductions for fathers and 84 percent of the hardship deductions for mothers.

There is a statistically significant difference in the percentage of IV-D and non-IV-D cases where a hardship deduction is applied, with IV-D cases being more likely to include a hardship deduction (7 percent of fathers and 5 percent of mothers) than non-IV-D cases (2 percent of both fathers and mothers). Modified orders noted more hardship deductions than new cases. The modifications include hardship deductions for 5 percent of fathers and 7 percent of mothers, whereas the new orders noted these deductions for 4 and 3 percent of fathers and mothers, respectively.

Commissioners were not surprised by the significant reduction in the percentages of cases with a hardship deduction. They agreed that, because hardship deductions are less frequently applied in new cases and are never applied in default cases, the decrease in hardship deductions is a result of the sample (where there was a drastic increase in the percentages of new and default cases) and not the result of any changes in policy or family situations.

The advocates believed that the hardship deductions are not consistently applied and that these deductions should be automatic. The commissioners, on the other hand, unanimously felt that these deductions need to be discretionary and that every case should be looked at individually. Commissioners gave examples of when they like to examine a case and control the hardship deductions. For example, if a noncustodial parent has subsequent children with a subsequent spouse and the new spouse has income, the noncustodial parent may be granted a partial hardship deduction because that parent is not the sole supporter of the additional children. Generally, the commissioners felt that they did not want to judge people’s choice in having more children and would grant some sort of hardship deduction to try and treat all children equally.

Exhibit 3-11 also shows a decrease in the percentages of cases where there is a deduction for child or spousal support. For fathers, this fell from 7 percent in the 2005 review to 3 percent in the 2010 review. This decrease is statistically significant. The percentage of cases where the mother received a deduction for child or spousal support also decreased, although this change is minor and is not statistically significant. The data collection instrument did not specify whether these deductions are for child support or spousal support.

For fathers, a deduction for child or spousal support was noted in more IV-D than non-IV-D cases—5 percent and 2 percent, respectively (this difference is statistically significant)—and in more modifications than new cases (4 percent and 3 percent, respectively). For mothers, just about 1 percent of cases noted these deductions regardless of IV-D and non-IV-D status and regardless of whether the case was a new order or a modification.

The Low-Income Adjustment

If an obligor earns less than \$1,000 per month in net disposable income, Family Code section 4055(b)(7) grants the obligor a low-income adjustment (LIA) as long as the adjustment is not unfair or inappropriate. As shown in Exhibit 3-12, eligibility for the LIA remained stable from the 2005 review to the 2010 review, with just about 15 percent of obligors eligible. This is somewhat surprising because of the increase in minimum wage since the last review but it is also not surprising because of the economic recession, which has produced job losses and reduced some jobs to part-time work. As shown later, more obligors have zero incomes.

Exhibit 3-12 also shows that in cases where the obligor was eligible for the LIA, it was actually applied in 59 percent of cases in the 2010 review and 52 percent of cases in

Exhibit 3-12. Eligibility for and Application of the Low-Income Adjustment in the 2010 and 2005 Reviews (Percentages of Cases)		
	2010 Review	2005 Review
Percentage of obligors not eligible for the LIA	86%	85%
Percentage of obligors eligible for the LIA	14	15
Of those eligible for the LIA:		
LIA applied	59	52
LIA not applied	40	48
Unknown	1	0

the 2005 review (a difference not statistically significant).

In IV-D cases, the LIA is applied in 65 percent of the cases where the obligor is eligible. The adjustment is granted in only 6 percent of the non-IV-D cases where the obligor is eligible. This difference is statistically significant.

When asked why the LIA would not be applied in certain cases, most of the commissioners agreed that they could not think of a situation in the IV-D caseload in which they do not grant the LIA where the obligor is eligible. However, they did note that the LIA is not consistently applied in defaults and stipulations. Indeed, the case file review data find that over 90 percent of the IV-D cases where the obligor is eligible for the LIA but it is not granted are entered through either default or stipulation.

In non-IV-D cases, the commissioners felt that sometimes obligors who should receive the LIA do not because of the way the automated guideline calculator is set up. When an obligor in a IV-D case is eligible for the LIA, it is very clear in the computer system and it is usually automatically applied (except in the cases entered through default or stipulation). In non-IV-D cases, a judge has to check to see if the obligor is eligible for the LIA and manually apply it.

Of the cases where the LIA was applied, most of the orders (89 percent) cover one or two children. The average monthly order amounts in cases where the LIA was applied is \$95 for one child, \$161 for two children, and \$177 for three children. If the LIA was not granted, the monthly guideline amount for an obligor earning \$1,000 per month (assuming the obligee has no income and the obligor has no physical responsibility for the child) would be \$225 for one child, \$360 for two children, and \$450 for three children.

The commissioners and advocates all agreed that the LIA in its current form creates orders that are too high for low-income obligors and ends up further impoverishing these obligors. Both groups felt that the LIA should be capped at \$1,500 per month instead of \$1,000. The commissioners also suggested that the ceiling could be set at full-time, minimum wage, so that legislation would not have to change when the minimum wage increases. Another suggestion the commissioners had is to provide a sliding scale low-income adjustment, with different adjustments for different incomes (e.g., \$500 a month; \$1,000 per month; and \$1,500 per month).

Orders for Additional Support

Under Family Code section 4062, courts may order additional child support to help pay for employment- or education-related child-care costs, uninsured health-care expenses, education costs or costs for other special needs of the child, and travel expenses for visitation. Under Family Code section 4061, the court is to assign a 50/50 split of these costs between the parents, unless either parent requests and the court finds a different apportionment or pro rating the expenses to be more appropriate.

As shown in Exhibit 3-13, fewer cases in the 2010 review included an additional support order for child care and uninsured health-care expenses (12 percent and 18 percent, respectively) compared to the previous review (where 15 percent and 25 percent, respectively, had orders for additional support for child care and uninsured health-care expenses included). These differences are statistically significant. The percentage of cases with an order for education or special needs expenses also fell from 3 percent to 2 percent. The commissioners, when asked about the decrease in child care ordered, stated that both the increased unemployment rate and greater numbers of people using relative care contribute to the relatively low percentage of cases with a child-care add-on.

Non-IV-D cases were more likely than IV-D cases to have an order for additional support to cover child-care (10 percent in IV-D cases and 13 percent in non-IV-D cases) or uninsured health-care expenses (17 percent in IV-D cases and 20 percent in non-IV-D cases), although these differences are not statistically significant. As discussed in detail in Chapter 5, new federal medical support rules that became effective July 2008 require that IV-D agencies petition for health insurance⁸⁰ for the children and/or “cash medical support” (which can be an order that addresses how the parents will pay for the children’s uninsured health-care expenses). The case file data indicate that 95 percent of IV-D cases contain an order for health insurance and/or uninsured health-care costs.⁸¹ Most often, an order for health insurance was included.

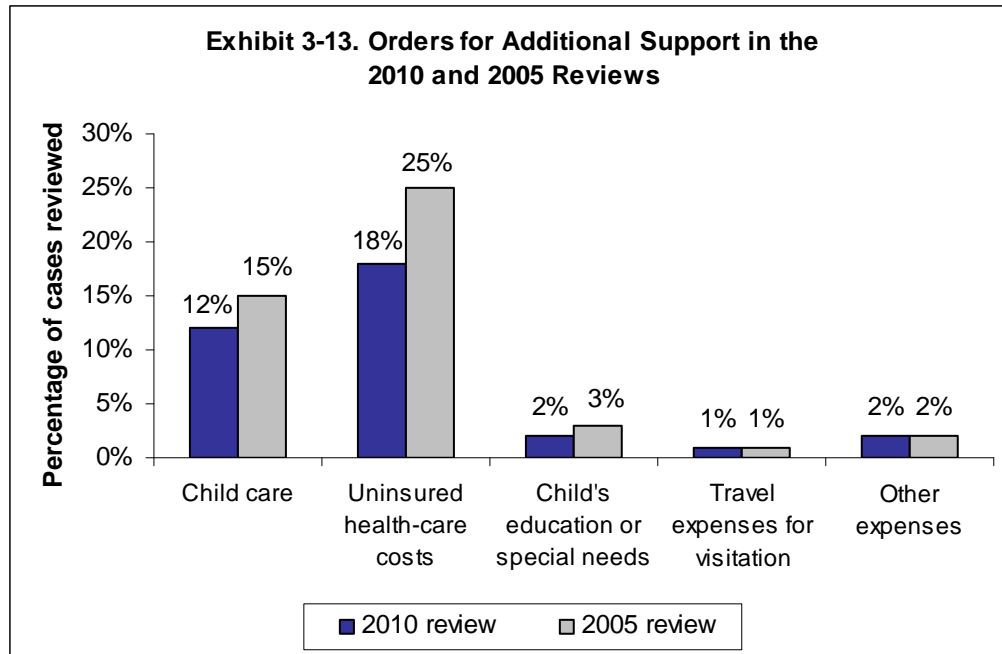

Provisions for child-care and uninsured health-care expenses are more likely to be contained in modified orders than in new orders. There is a statistically significant difference between the percentages of new cases and modifications with child-care and uninsured health-care costs ordered. New cases had an add-on for child care in 11 percent of cases and uninsured health-care costs in 17 percent of cases, whereas modifications had add-ons for child care in 23 percent of cases and for uninsured health-care expenses in 39 percent of cases.

The California guideline provides several options for allocating additional support between the parents. It can be split 50/50, or it can be prorated between the parents if requested. It can be ordered as a percentage of the expense or as a fixed dollar amount. Other state guidelines generally provide fewer options. For example, most state guidelines prorate work-related child-care expenses between the parents and incorporate the adjustment for the prorated expenses into the final support award. Few state guidelines provide that the order for child care is a percentage of the expenses and to be paid directly to the child-care provider. Other state guidelines,

⁸⁰ As discussed more in Chapter 6, the health insurance must also be “reasonable” in cost and “accessible” to the child, where the definitions of “reasonable” and “accessible” are at state discretion. Further, if accessible insurance is not available at a reasonable cost when the order is entered, the IV-D agency must petition for cash medical support (45 C.F.R. § 303.31(2)). The data available in the court case files generally do not note whether accessible insurance was available at a reasonable cost when the order was entered, but part of the sample period was before the federal requirement became effective.

⁸¹ This is consistent with information from IV-D cases tracked by DCSS. For example, medical support is ordered in 90 percent of California IV-D cases with established support orders. Cal. Dept. of Child Support Services, *Comparative Data for Managing Program Performance: Federal Fiscal Year 2008* (Apr. 2009).

however, will typically provide that the order for uninsured health-care expenses can be a percentage. An order in which each parent is responsible for a percentage of uninsured expenses is practical when the expense is in the future, may or may not occur, and is of an unknown amount. For example, suppose that five months after the order was established the child was involved in a playground accident, the child received medical care, and the amount of uninsured expenses was fairly large. A percentage order would more appropriately cover this situation.

In 66 percent of the California orders for additional child-care expenses, the court split the costs 50/50 between the parents, the order was specified as a percentage other than 50/50 in 4 percent of cases, and it was specified as a fixed dollar amount in 29 percent of cases. Eighty-seven percent of the orders for uninsured health-care costs were equally split between the parents, the order specified a different apportionment in 12 percent of cases, and the order specified a fixed dollar amount in 1 percent of the cases.

The commissioners appreciated that these items are add-ons and felt that this is the appropriate way to include these other costs into the guideline. The advocates, on the other hand, felt that these add-ons complicate the guideline calculation and that all these factors end up causing more conflict between the parents.

Health Insurance

The California guideline deducts the cost of health insurance for a parent and for any child the parent has an obligation to support from that parent's gross income. There is an order for a parent

to provide health-care insurance in 80 percent of the cases reviewed.⁸² The mother must provide the coverage in 9 percent of these orders, the father is ordered to provide health-care insurance in 48 percent of cases, and both parents are ordered to provide the insurance in 42 percent of these cases.

The case file review data found that about 5 percent of parents do not have health insurance available to them at a “reasonable cost”; however, the data do not specify whether the remaining parents actually have health insurance available or that health insurance was reasonable in cost. When asked what they define as “reasonable,” one commissioner stated that he used 10 percent of income but said it may vary based on the situation. Other commissioners did not have a consistent threshold. As mentioned earlier, new federal regulations require that states specify a quantitative threshold for determining whether medical support is reasonable in cost. (More information on these federal requirements is provided in Chapter 5). Most states define the child’s premium to be reasonable if it does not exceed 5 percent of the income of the parent carrying the insurance. The commissioners felt that 5 percent is too low because it often costs more than that for a parent to insure a child. Further, they believe this threshold will result in many uninsured children. In the advocates’ opinions, the guideline should not even include health insurance and it should be a separate issue for two reasons: When children are covered under Medicaid, there are no premium costs. If there are insurance premiums for children not on Medicaid, the premiums should be included in the base obligation. Otherwise, parents squabble over the additional expense.

Almost all other states prorate the child’s cost of health insurance between the parents and add it to the base child support amount, in much the same way as the additional expenses described in the previous section. The commissioners unanimously felt that this is how the guideline should treat health insurance. They believed that the way the guideline currently uses the health insurance premium as a deduction from income minimally affects the order amount and does not distribute the premium cost in an equitable way between the parents. According to the commissioners, the parent providing the insurance should receive more of either a reduction (for noncustodial parents) or an increase (for custodial parents) in the child support order.

Income of the Parents and Other Case Circumstances

This subsection considers the gender of the obligors, parental incomes, attributed incomes, attorney representation, order amounts, zero dollar and reserved orders, and time-sharing arrangements.

⁸² Previously, orders for health-care insurance were discussed in conjunction with orders addressing how the parents would pay for the children’s uninsured health-care expenses because of the federal requirement of IV-D agencies to petition for either or both.

Gender of the Obligated Parents

The California guideline designates the obligated parent based on the parents' relative incomes and the time that each parent spends with the child. The calculation of support may result in the designation of the higher-income parent as the obligor even when this parent is the primary custodian of the children.

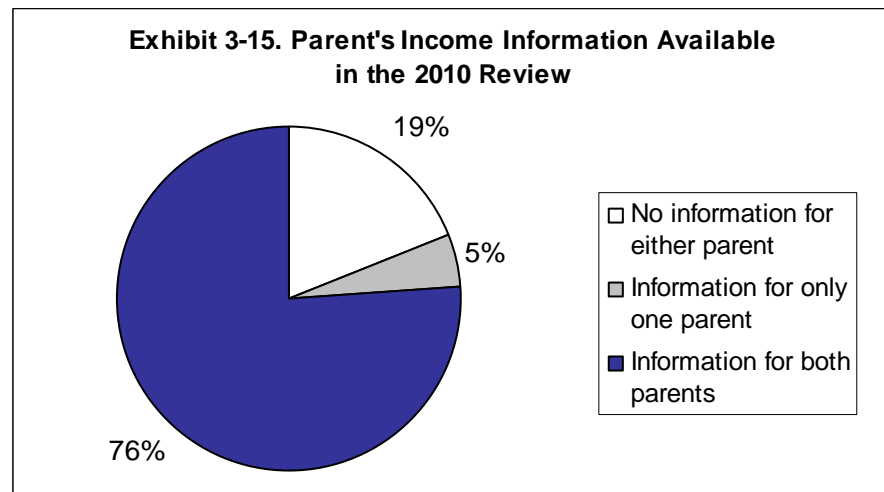

Exhibit 3-14 shows that the father is designated as the parent to pay child support in 87 percent of all cases. The mother is the obligor in 7 percent of the cases. In a few remaining cases (5 percent) the obligated parent is either unspecified or neither parent is required to pay support.

Parental Incomes

In general, average and median parental incomes were about the same or less than parental incomes in the last review. Undoubtedly, this reflects the economic recession.

As shown in Exhibit 3-15, neither gross nor net income was available for either parent in 19 percent of the cases reviewed for this study. One parent's income was unavailable in another 5 percent of the cases. In other words, 24 percent of the reviewed cases were missing income information for one or both parents. The breakdown of income information availability by IV-D cases was: not available for either parent (13% of IV-D cases); available for one parent but not the other (7 percent of IV-D cases); and available for both parents (61 percent of the IV-D cases). The breakdown of income information availability by non-IV-D cases was: not available for either

parent (25% of non-IV-D cases); available for one parent but not the other (4 percent of IV-D cases); and available for both parents (71 percent of the IV-D cases).

The cases that were missing at least one parent's income information were primarily IV-D default cases (35 percent) and non-IV-D stipulations (35 percent). In IV-D default cases, the obligor may not have provided income data, and the child support agency might not have been able to determine this information from sources such as the National Directory of New Hires. Stipulations in non-IV-D cases are examples in which the court is likely to be less demanding of supporting documentation.

Gross Income in the Guideline Calculation

Although the California guideline formula is based on net income, most commissioners (and other guideline users) start with gross income in the calculation of support. This approach is consistent with Family Code section 4059, which specifies that annual net disposable income of each parent shall be computed from his or her gross income.

Commissioners from the study counties generally find that starting from gross income results in a more accurate calculation and one more consistent with Family Code section 4059 than does the use of after-tax income information from sources such as a parent's paycheck stub. In fact, most commissioners use an automated child support calculator that starts from gross income and then calculates the parent's annual net disposable income and the amount of child support in accordance with Family Code section 4059.⁸³ The commissioners unanimously agree that this is the appropriate way to calculate the guideline. They felt that using gross income would result in unfair orders because some parents may be smarter tax planners than others. Taking into account other hardships or additional children from prior or subsequent relationships would also be difficult if gross income were used. The advocates, on the other hand, felt that if the guideline were to continue to be income based, basing the order on gross income would be more appropriate. They thought that this would obviate differences in the child support award that they believed exist when the parent's tax consequences are affected by that parent's subsequent spouse. For example, one focus group participant believed that if a low-income obligee married a second spouse with high income, the child support award would increase significantly because it would decrease the obligee's after-tax income available for support and hence increase the obligor's share of support. This would occur because the subsequent spouse's income effectively put the obligee in a higher tax bracket. However, the focus group did not discuss how and whether this outcome would be consistent with guideline provisions that limit the consideration of subsequent spouse income (Fam. Code, § 4057.5).

Starting from gross income has unintended outcomes. The first is that the case file will note the parent's gross income, not always the net income used to calculate the guideline amount. Inclusion of the printout generated by the automated guideline calculator in the case file would

⁸³ In other words, most commissioners use what is called "standardized net." As discussed in Chapter 2, most gross-income guidelines are actually based on standardized net income, but the gross-net conversion is hidden in the child support schedule.

show how the net disposable income (and thus the basis for the award) was determined. The second consequence is that some low-income parents showed more net disposable income than gross income. For example, 23 percent of obligees with known income had more net disposable income than gross income. The average gross income among these obligees was \$1,322 per month. Commissioners suggested that this outcome was likely because the federal earned income tax credit was applied in these cases. Interestingly, some of the commissioners also noted that an obligor might also be eligible for the earned income tax credit. However, only a small percentage (3 percent) of cases involved obligors with known income in which the obligor’s net disposable income was greater than the obligor’s gross income. The obligor’s gross income in these cases averaged \$1,527 per month.

Average and Median Income of the Parents

As shown in Exhibit 3-16, almost a quarter of the case files did not include income information for one or both parents. For mothers, 24 percent of the cases lacked income information. Among fathers, the figure was 21 percent. For both mothers and fathers, income information was more likely to be absent in non IV-D cases than in IV-D cases. The information presented in Exhibit 3-16 includes cases with imputed or presumed income.

Exhibit 3-17 shows the percentages of fathers and mothers who have monthly gross and net incomes of \$0. Cases with imputed or presumed incomes are excluded in this analysis. Of all men in the 2010 review, 15 percent show no gross monthly earnings and 17 percent show no monthly net earnings. Among women in the 2010 sample, 46 percent show no gross monthly earnings and 42 percent show no net monthly earnings.

Mothers and fathers in the IV-D caseload made up most of the parents with zero dollar incomes: 67 percent of mothers and 26 percent of fathers in the IV-D caseload had zero dollar gross and net incomes. In the non-IV-D caseload, 15 percent of mothers and 3 percent of fathers had zero gross income, while 17 percent of mothers and 4 percent of fathers had zero net income.

The commissioners and advocates felt that new case law requiring DCSS to give incarcerated parents zero incomes instead of imputing income may have contributed to the increase in zero-income parents. Some commissioners also noted that, instead of presuming income for other obligors, they will give the obligor zero monthly income.

The \$0 earnings are included in the means presented in Exhibit 3-18. This exhibit shows that, for both men and women, the average gross and net monthly incomes are higher among non-IV-D than IV-D cases. For example, among fathers, the average monthly income for non-IV-D cases was \$4,680, compared to \$1,680 for IV-D cases. Mothers earned less than fathers in general and when controlling for IV-D status.

Exhibit 3-19 presents similar income comparisons using median earnings.

Relative Income of the Parents

Exhibit 3-20 compares cases with income information on both parents. It shows that mothers are about three times as likely as fathers to show no monthly earnings, while fathers are more than twice as likely as mothers to have monthly earnings above \$4,000.

**Exhibit 3-20. Comparison of Parents' Monthly Incomes in Cases With
Income Information for Both Parents (Percentage of Cases)***

	Mother's Gross Income	Father's Gross Income
\$0	38%	11%
\$1– \$1,000	9%	9%
\$1,001–\$2,000	23%	25%
\$2,001–\$3,000	11%	17%
\$3,001–\$4,000	6%	9%
\$4,001 or more	12%	29%
Number	618	618

* Excludes cases with imputed, presumed, or missing income information.

Attributed Income

California attributes income to parents in two different ways, by imputing income or by presuming income. If the court does not have access to actual income information, under Family Code section 4058(b) the court may instead take into consideration a parent’s earning potential and impute income if it is consistent with the best interest of the child. The court does this if it has information on a parent’s prior work history. Family Code section 17400(d)(2), which is not part of the guideline, states that if the local child support agency can find no evidence of income or any information about an obligor’s work history, the obligor’s income is presumed at minimum wage for 40 hours per week. Using the current California minimum wage, an obligor’s gross income when presumed is \$1,386 per month.

As shown in Exhibit 3-21, the percentage of cases with imputed income decreased for both obligors and obligees from 7 percent in the last review to 3 percent in the current review, while the percentage of cases where income is presumed increased from 3 percent in the 2005 review to 5 percent in the 2010 review. All these changes are statistically significant. For IV-D cases alone, income was imputed or presumed for 15 percent of the obligors. This is not statistically different from the last review.

According to the commissioners, income imputation decreased because it is hard to show available work; therefore, they are less willing to impute. Both the commissioners and the advocates attribute the increase in presuming income to the higher rate of default cases in the review. Indeed, the data support this conclusion—93 percent of the cases where the obligor’s income is presumed are orders entered by default.

Attorney Representation

In this case file review, like the previous review, data collectors captured information on whether parents are represented by attorneys. If the child support agency establishes or modifies the child support order under Family Code section 17400, the agency does not represent either parent. For the purposes of this review, attorney representation is defined as private counsel retained by a parent.

As shown in Exhibit 3-22, attorney representation increased between 2001 and 2005, then fell from 2005 to 2010. In the 2010 review, neither parent retained a private attorney in 80 percent of the cases reviewed. Comparatively, in the 2005 review, neither parent was represented by an attorney in 65 percent of the cases. The percentage of cases where attorneys represented both parents fell from nearly one-quarter in 2005 to 12 percent in 2010. Only the obligor in the case retained counsel in 3 percent of the cases in 2010 review; this represents a 50 percent decrease from the 2005 rate of 6 percent. All these changes are statistically significant. There was no statistically significant change in the percentage of cases where just the obligee was represented by an attorney.

Further examination of attorney representation shows little difference in the percentage of parents retaining private counsel in IV-D cases in the 2001, 2005, and 2010 reviews. (Exhibit 3-23

displays this information.) In non-IV-D cases, however, there were statistically significant changes between the 2005 and 2010 reviews in the percentages of cases where neither parent was represented and both parents were represented. As shown in Exhibit 3-24, neither parent retained private counsel in 62 percent of cases in 2010 review, compared with 36 percent of cases in the 2005 review. The percentage of cases where attorneys represented both parents decreased by 50 percent between the two latest study samples—from 44 percent in the 2005 review to 22 percent of cases in 2010 review.

These changes in attorney representation, however, have not significantly impacted the frequency of unrepresented litigants in hearings. Neither parent retained counsel in 67 percent of contested hearings in the 2001 review, 64 percent of contested hearings in 2005, and 62 percent of contested hearings in 2010. Neither of these changes is statistically significant.

**Exhibit 3-23. Attorney Representation by Case Type in the 2010, 2005, and 2001 Reviews
(Percentages of Cases)**

*The difference between the groups is significant at <.05.

Number of Children Covered by the Orders

As shown in Exhibit 3-24, most orders cover only one child (65 percent), 26 percent cover two children, 7 percent cover three children, and 2 percent cover four children. Taken together, 91 percent of the cases provide child support for one or two children. These patterns are very consistent with those found in previous years, including 2005 and 2001.

Amount of the Child Support Order

Exhibit 3-25 shows the average monthly child support orders in 2005 and 2010 for all cases and for IV-D and non-IV-D cases. The exhibit does not break order levels down according to the number of children. As this exhibit shows, order levels between 2005 and 2010 have declined. For all cases, the average child support order in 2005 was \$574 per month. In 2010 the comparable figure is \$470. Among IV-D cases, average order levels declined from \$341 to \$286. For non-IV-D cases, the decline was from \$795 to \$685 per month.

Similar declines in order levels occurred for parents with one child, two children, or three or more children. Exhibit 3-26 shows declines between 2005 and 2010 for IV-D and non-IV-D cases with various numbers of

children.

Exhibit 3-27 presents information on the median orders for all cases, all IV-D cases, and all non-IV-D cases.

There are also some differences between the average 2010 orders in new versus modified cases. specifically:

- In 2010 IV-D cases, the average order amount in a new establishment case was \$274, compared to \$432 in modified orders.
- In 2010 non-IV-D cases, new orders averaged \$671, while modifications averaged \$888.

There were also some differences in order levels related to whether the order was established by default or stipulation or through a contested hearing. In 2010, default orders averaged \$302, while those set in a contested hearing averaged \$610 and stipulations averaged \$599. Of course, income is related to order entry method. Average monthly gross incomes for obligors were \$1,694 for those with default orders, compared to \$3,593 and \$4,001 for contested cases and stipulations, respectively.

Exhibit 3-28 shows significant differences between orders based on actual versus attributed (i.e., presumed or imputed) incomes. Overall, obligors with actual earnings had orders averaging \$493 per month, while obligors with imputed incomes had orders averaging \$237 per month. Similar differences exist in the IV-D and non-IV-D populations.

**Exhibit 3-28. Average Order Levels for Obligor Having Orders Established
With Attributed and Actual Earnings**

	Attributed Income	Actual Income
Average all cases	\$237	\$493
Average among IV-D cases	209	300
Average among non-IV-D cases	494	689

Child Support Order Levels as a Percentage of Obligor Income

Exhibit 3-29 shows the average amount of the obligor’s monthly net income that is consumed by the monthly child support order. The analysis is limited to only those cases with known incomes. Cases where income is imputed or presumed are excluded. The exhibit shows that obligors with net earnings between \$1,001 and \$1,500 monthly pay approximately the same percentage of their incomes in child support (i.e., about 20 percent). It also shows that obligors earning more than \$4,000 monthly pay 24 percent of their income. Although this is counterintuitive to the guideline formula, because the formula results in a declining percentage as income increases, case circumstances explain some of the difference. Obligor with incomes above \$4,001 per month were more likely to have more children and hence higher orders.

Zero-Dollar and Reserved Orders

The California guideline results in a zero-dollar order if the obligor’s income is \$0 per month. Another situation where a zero-dollar order may be entered is when the parents have equal (or close to equal) incomes and time share. In these cases, the orders may come out to zero dollars or the order is so small that the parents deviate to a zero-dollar order.

In the 2010 review, 14 percent of the monthly child support orders are zero-dollar orders. This represents a statistically significant increase from the 2005 review, when 7 percent of the cases had zero-dollar orders. Most of the zero-dollar orders in the 2010 review (60 percent) were cases where the guideline resulted in a zero-dollar order, 17 percent of the zero-dollar orders were

deviations, and in 23 percent of these cases it was unknown whether the order was the result of a deviation from the guideline.

Both the commissioners and advocates felt that some of the zero-dollar orders can be attributed to incarcerated or disabled noncustodial parents. They felt that DCSS is doing a better job of locating incarcerated noncustodial parents to learn that they have no income instead of giving these parents a minimum order. The commissioners also noted an increase in default judgments that include a calculation that results in a zero-dollar order. For example, if there is no evidence of obligor income and no possibility for the obligor to earn any income, a zero-dollar order is entered.

In the 2010 review, 10 percent of the orders were listed as “reserved.” The definition of the term “reserved” is not uniform. Indeed, during the focus group with commissioners, much of the conversation regarding the percentage of reserved orders focused on trying to determine what exactly constitutes a reserved order. In some cases, reserved orders may be entered when it appears that an obligor’s income will change or become known in the near future. In this type of situation, courts specify an order amount but reserve jurisdiction to review and, if appropriate, modify the order when the new or complete information becomes available. Courts often specify a time for the review (e.g., in 60 days). During the focus group, the commissioners noted that these types of orders are often entered because reserving and changing an order is less cumbersome and time consuming than modifying an order.

Time-Sharing Arrangements

One of the main factors in California’s child support guideline formula is shared physical responsibility. Specifically, Family Code section 4055(b)(1)(D) describes this component of the formula as the “approximate percentage of time that the high earner has or will have primary physical responsibility for the children compared to the other parent.” On average, the child’s time with the obligor in the case was 17 percent (up from 15 percent in the last review). The median amount of time with the obligor did not change from the 2005 to the 2010 review (it was 10 percent in both years).

Exhibit 3-30 gives more information on the percentage of time that the child spends with the obligor in IV-D and non-IV-D cases. As shown in the exhibit, obligors in the IV-D caseload tend to have less custodial time with the children than those in the non-IV-D caseload. The largest

difference between the two groups is the obligors with zero primary physical responsibility of the child. Less than 10 percent of the non-IV-D obligors fell into this category, compared to 62

	IV-D Cases	Non-IV-D Cases
Zero percent*	62%	9%
1 to 20 percent*	23%	48%
21 to 40 percent*	7%	17%
41 percent or higher*	8%	26%
Number	463	439

* The difference between the groups is significant at <.05.

percent of the IV-D obligors. In these cases and when net income was known for both parents, the obligor was the higher earner in 69 percent and 68 percent of IV-D and non-IV-D cases, respectively.

Limitations of the Data and Analysis

As in previous reviews, the case file data were limited in several ways. The major limitation was missing or incomplete information. Exhibit 3-31 shows the percentage of cases in the 2010 review where the data collectors noted that certain information was missing in the case file.

Exhibit 3-31. Information Missing From the Case Files	
(Percentage of Cases)	
	2010 Review (n = 1,226)
No documents on the result of calendared child support court events	10%
Parents' income not specified	19
Amount of child support not specified	9
Guideline amount not specified	22
Above or below guideline amount not specified	19

In addition to these missing data, financial statements or income and expense declarations were available in only about one-third of the court files. Data are missing in both IV-D and non-IV-D cases. When missing data are broken down by the order entry method, the majority of missing information is, not surprisingly, from cases that were entered either through default or stipulation. Specifically:

- Eighty-five percent of cases that are missing documents on the result of calendared child support court events were either stipulations or defaults;
- Stipulations and defaults make up 89 percent of the cases that do not list parents' income;
- Nearly all of the cases missing the child support amount (96 percent) were either defaults or stipulations; and
- Stipulations and defaults make up 88 percent of cases where the guideline amount was not specified or where an indication whether the order was above or below the guideline was not included.

The commissioners suggested that legislation could be passed to require the printout of the calculation to be attached to every case file. As previously stated, the commissioners also noted that some of this information may be available in their oral ruling but may not be included in the case file.

An additional limitation in the data is that the sample used for this review contained more new orders and fewer modified orders than the last review. It is impossible to know whether this reflects an actual trend or is an artifact of a difference between the data collection methods

employed in the reviews. Both focus groups did not believe this reflects an actual trend rather than that is an artifact of the data collection method.

Chapter Summary

Since the last review of the California guideline, the guideline deviation rate has increased. There is less application of many guideline adjustments (e.g., hardship deduction) and orders for additional support (e.g., orders for the child's uninsured health-care expenses). There are more default orders. There are more zero orders. Even though the minimum wage has increased and the income threshold for applying the low-income threshold (i.e., incomes below \$1,000 per net income) has not changed since the last guideline review, the low-income adjustment is being applied more frequently than it was during the last review. In general, average and median parental incomes are about the same or lower than they were during the last guideline review. Attorney representation is down. Although there are many other factors, the economic recession is the dominant factor explaining these trends.

CHAPTER 4

Low-Income Parents and Child Support Guidelines

This chapter looks at how states address the application of child support guidelines to the low-income population. It starts with a brief overview of impoverished and low-income families. Next it discusses the challenge of dealing with the low-income population in child support guidelines. Finally, it discusses the three major provisions in state guidelines that affect order amounts for low-income families: income attribution provisions, adjustments to the guideline calculation based on child-rearing costs in cases of low income, and minimum orders.

Impoverished and Low-Income Families

A large percentage of American families have low incomes. In 2008, 15 percent of American families with children under age 18 years and almost one out of five children lived in poverty.⁸⁴ Although data are not yet available, researchers believe that the current economic recession has worsened the financial situation of families.

The Great Recession of 2008 and 2009 has battered America's families. The unemployment rate has more than doubled since the start of the recession, topping 10 percent—the highest level in over a quarter of a century. In addition, families' capacity to weather economic downturns has been diminished as savings and assets have eroded due to simultaneous collapses in the housing and stock markets and the tightening of consumer credit. Even though the economy started growing again in the second half of 2009, most forecasters expect that it will take years for unemployment and family incomes to return to their pre-recession levels.⁸⁵

Single-parent families are even more likely to live in poverty. Nationally, the poverty rate for single-parent families is 36 percent, which is more than twice the poverty rate for all families with children under age 18.⁸⁶ The trend in California is slightly worse. Nearly 39 percent of California families with a female householder (no husband present) and related children under 18 years of age are below the poverty level, compared to 18 percent for all California families with related children under 18.⁸⁷ The disparity between the poverty rates among female householders

⁸⁴ Calculated from U.S. Census Bur. American Factfinder, "S1702. Poverty Status in the Past 12 Months of Families" and "S0901. Children Characteristics," downloaded on April 4, 2010, from <http://factfinder.census.gov>.

⁸⁶ (U.S. Census Bur. American FactFinder, *supra* note 84.)

⁸⁷ Calculated from U.S. Census Bur. American FactFinder, "B17006. Poverty Status in the Past 12 Months of Related Children Under 18 Years By Family Type And By Age of Related Children Under 18 Years," http://factfinder.census.gov/servlet/DatasetMainPageServlet?_program=ACS&_submenuId=datasets_1&_lang=en&_ts= (as of Mar. 30, 2010).

and all families is even more pronounced when only those families with very young children are considered. Almost half (46 percent) of California female householders, compared to 19 percent of all California families, with related children under 5 years old live in poverty.⁸⁸

Moreover, a recent study finds that the poverty rate among California children is growing.⁸⁹ The study forecasts that the number of California children living in poverty will increase by 850,000 within two years. The same study also notes that the federal poverty level is not sensitive to California's living costs. The authors suggest that the actual number of California families unable to meet their basic needs is twice the number of California families with incomes below the federal poverty level. Their projections suggest that as many as 2.7 million California children may live in households that cannot meet their basic needs.

The population served by state-run child support services agencies, which mostly comprises families that currently or formerly received public assistance, is particularly disadvantaged. Perhaps the best source for looking at the characteristics of custodial parent families using the services of state-run agencies (also called the IV-D system) is an analysis of national data completed by the U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation. The last available report, from 2004, uses data from 2001 and earlier surveys. This report found that about 41 percent of all IV-D families had a family income under \$20,000 in 2001 and that about 57 percent had an income under \$30,000.⁹⁰ About one-third of the IV-D families had incomes below the poverty level, and about three-fifths had incomes below 200 percent of the poverty level. Nearly 16 percent of IV-D families were in "deep poverty," with incomes below 50 percent of the poverty level.

Research from other national survey data finds that the custodial parents receiving child support and the noncustodial parents paying child support tend to mirror each other with regard to income status, as well as educational levels and barriers to employment.⁹¹ Although somewhat dated, a 2003 report on child support arrears is still perhaps the best source of information on the income status of noncustodial parents in California.⁹² Some of the report's findings are as follows:

- Parents with child support arrears have lower earnings than other California workers. In 1999, parents with child support arrears had median earnings of \$14,110, compared to \$16,635 for other California workers.⁹³

⁹³ *Id.* at p. 6.

- More than 60 percent of parents with child support arrears in 1999 had recent (reported) net incomes below \$10,000. A quarter of the parents had no reported recent income, and 36 percent had reported income of less than \$10,000.⁹⁴

Not knowing the obligor's income or income history affects the support award amount. California Family Code section 17400(d)(2) provides that when this is the circumstance in IV-D cases, full-time minimum wage earnings are to be presumed as the obligor's income. As discussed in more detail, this may overstate the obligor's income, particularly if he or she is involuntarily unemployed or can find only part-time work.

National research is consistent with the California research and shows that obligors, particularly young nonmarital fathers, are a disadvantaged group with low incomes. One source of national research on nonmarital fathers comes from the *Fragile Families and Child Wellbeing Study*.⁹⁵ The most comprehensive study on nonmarital births, it followed a cohort of parents and their unborn children in 20 U.S. cities, finding that just 76 percent of the fathers were employed in a regular job and on average earned just over \$16,000 per year.⁹⁶

Researchers suggest that many young, unwed fathers have difficulty supporting themselves, much less a child. One study estimates that at least 16 percent, and possibly as many as 33 percent, of young noncustodial fathers do not pay child support and are unable to do so without further impoverishing themselves.⁹⁷ These fathers tend to be young, are disproportionately African American, and have limited education.⁹⁸ Only 43 percent of low-income, nonpaying fathers work in the labor market, and one-third have not held a job for more than three years.⁹⁹

Because the majority of noncustodial parents are male, there are limited data sources and analysis regarding female noncustodial parents. The only study that examines female noncustodial parents, however, found that they are similar to noncustodial parents but earn less and are likely to have some children living with them.¹⁰⁰

⁹⁷ Ronald Mincy & Elaine Sorensen, "Deadbeats and Turnips in Child Support Reform" (Dec. 1998) 17(1) *J. Policy Analysis & Management* 44–51. This study finds that about 39 percent of young custodial mothers and their children live in poverty. Young custodial fathers, therefore, are almost as likely to live in a poor family or have poverty-level incomes as young custodial mothers.

⁹⁹ Sorensen & Zibman, *supra* note 91.

¹⁰⁰ Liliana Sousa & Elaine Sorensen, "The Economic Reality of Nonresident Mothers and Their Children," (Urban Inst., 2006).

The current employment and earnings of noncustodial parents are also undoubtedly worse because of the economic recession. At the time this study was conducted, the most recent California employment data available (February 2010) indicated that the number of unemployed Californians had increased by over 400,000 in the previous year.¹⁰¹ With an unemployment rate of 12.5 percent, February 2010 marked California's 40th consecutive month of unemployment increases. Growth in underemployment is also a problem. The underemployment rate, which includes part-timers and people who want to work but have given up looking, reached about 20 percent in California as of January 2010.¹⁰²

Unemployment patterns are even worse for racial and ethnic minorities, which increasingly characterize the child support caseload. As of 2002, almost half (44 percent) of the nation's custodial parents were minorities.¹⁰³ And in March 2010, while unemployment stood at 8.8 percent for whites, it was 12.6 percent for Hispanics and 16.5 percent for African Americans.¹⁰⁴

The low-income status of much of the child support population, both custodial and noncustodial parents, poses challenges in setting child support order amounts. When both parents are poor, there is simply not enough money to go around. This makes decisions about how to divide up the family's money very difficult and guarantees that no matter how it is divided, the children's needs will still not be met.

Guideline Amounts at Low Incomes

Many researchers and policymakers argue that current child support guidelines may not be sensitive enough to the circumstances of low-income noncustodial parents.¹⁰⁵ They contend that setting the child support guideline too high for these parents may have negative consequences for both parents and children. According to some experts, some child support guidelines are too regressive, requiring low-income noncustodial parents to pay a larger share of their income toward child support than higher-income noncustodial parents.¹⁰⁶ One reason for this pattern is

¹⁰⁶ For example, see Daniel Meyer, "The Effect of Child Support on the Economic Status of Nonresident Fathers," ch. 3 in *Fathers Under Fire: The Revolution in Child Support Enforcement*, ed. Irwin Garfinkel et al. (Russell Sage Foundation, 1999); (Sorensen & Zibman, *supra* note 91); (Maureen A. Pirog et al., *supra* note 105).

that state guidelines are generally based on the cost of raising children, which does not increase proportionally as income levels rise. The reality is that poor families often have expenses that exceed their income, while high-income families have costs that fall below or match their income and are able to accumulate wealth through savings, the purchase of a home, or other means. In states that base their guideline formula on actual child-rearing expenditures, the result is that the percentage of income assigned to child support is much higher at low incomes than the percentage of income assigned to child support at high incomes.

The problem of high percentage orders for low-income obligors is exacerbated if their actual earnings are less than what is used to determine the order amount under the guidelines. This occurs if the court or tribunal attributes income when the obligated parent's income is unknown or there is little or erratic documented wage and employment history. This is also a guidelines issue, because most state guidelines provide for income attribution. As discussed earlier, California statute provides for two types of attributed income, "imputed," and "presumed" income.¹⁰⁷ Further, as discussed later, presumed income is a particular problem in California IV-D cases because it requires attributing income at full-time minimum wage earnings when the obligor's income or income history is unknown even though local employment opportunities may be limited.¹⁰⁸

The potential consequences if child support obligations are set too high for low-income obligors include:

- Potential inability of obligors to meet their own needs at a subsistence level;
- Reduction of the obligor's incentive to work and to work in the mainstream economy;
- Possibility that nonpayment of child support may reduce parent-child involvement¹⁰⁹ and, in turn, have negative consequences on the child's outcomes;¹¹⁰ and
- Increased compliance and enforcement issues and accumulation of arrears.

Each of these issues is discussed in more detail below.

¹⁰⁷ For the purpose of comparing California to other states, the term "attributed income" is used to encompass any situation where an income other than the parent's actual income is used to determine the support award. As discussed later, "attributed income" can encompass either "imputed income" or "presumed income," both of which are defined in California statute. Most states, however, just use one term to mean the same thing and use the term "imputed income." In other words, the distinction between imputed and presumed income is unique to California.

¹⁰⁸ Fifteen percent of California's IV-D orders in federal fiscal year 2008–2009 were established by default using presumed income. In other words, income was presumed to the obligor in about 9,400 orders established in federal fiscal year 2008–2009. Cal. Dept. of Child Support Services, "Comparative Data for Managing Program Performance," *Federal Fiscal Year 2008* (Apr. 2009), table 3.12, www.childsup.ca.gov/Reports/tabid/147/Default.aspx.

High Orders and the Obligor's Subsistence

A high child support order can drive an impoverished obligor further into poverty. For those obligors living just above poverty level, payment of a high order amount may not leave the obligor with sufficient income to live at a subsistence level.¹¹¹ For example, if an obligor with one child works full-time at minimum wage (\$8 per hour in California), his or her monthly gross income would be \$1,386, which is equivalent to \$1,200 net per month after taxes. According to the state guideline, the child support amount would be \$300 per month in this case.¹¹² After payment of taxes and child support, this leaves the obligor with spendable income of \$900 per month. Since the 2009 federal poverty level for one person is \$10,830 per year (\$902.50), paying the child support order would render the obligor impoverished. If the obligor owes arrears, he or she may be required to pay additional amounts for arrears and interest on the arrears. In some cases, up to 65 percent of income may be withheld from the obligor's paycheck to satisfy the child support debt.

The 2003 study titled *Examining Child Support Arrears in California: The Collectibility Study* revealed that many parents owing child support arrears had inordinately high orders.¹¹³ For example, the study found that parents owing child support arrears with incomes of \$0 to \$5,000 net per year had a median child support order of \$280 a month (about \$3,360 per year) and an average order that was twice their income. Even parents owing child support arrears with net annual incomes between \$5,000 and \$10,000 faced inordinately high orders. For this group, the median monthly order of \$276 a month (\$3,312 per year) represents 44 percent of their net income. Order amounts that exceed an obligor's actual income can occur if the income amount used to determine support is greater than the obligor's actual income. This occurs when income is imputed¹¹⁴ or presumed¹¹⁵ or the obligor's income decreases after the order is established and the order is not modified.

Other national studies find similar trends in order amounts among low-income obligors. For example, an evaluation of noncustodial parents served by responsible fatherhood programs funded by the Office of Child Support Enforcement in four states found that child support obligations comprised 57 to 125 percent of monthly earnings for participating noncustodial parents who earned \$500 per month or less. In contrast, among noncustodial parents with monthly incomes that exceeded \$2,000, child support obligations were only 10 to 23 percent.¹¹⁶ Indeed, other studies estimate that 25 percent of poor, nonresident fathers who actually pay child

¹¹¹ *Ibid.*

¹¹² This is based on the child support calculator provided by DCSS at www.cse.ca.gov/ChildSupport/cse/guidelineCalculator. The calculation assumes that the other parent has no income and no timesharing, which is the common situation when support is being determined in public assistance cases.

¹¹³ Sorensen & Zibman, *supra* note 91 at p. 9.

¹¹⁴ As will be further discussed later in this chapter, Family Code, section 4058(b) provides for income imputation.

¹¹⁵ As will be further discussed later in this chapter, Family Code section 17400(d)(2), which falls outside the Statewide Uniform Guideline, provides for income presumption.

¹¹⁶ Jessica Pearson et al., *OCSE Responsible Fatherhood Programs: Client Characteristics and Program Outcomes*, (U.S. Dept. of Health & Human Services, Sept. 2003).

support pay more than 50 percent of their income in child support, while only 2 percent of nonpoor fathers pay such a large amount.¹¹⁷

If low-income, noncustodial parents are pushed further into poverty, their remaining spendable income may not be sufficient to cover their basic needs. This is especially true in cities with higher housing costs. The net effect of disproportionately high child support orders could be higher rates of homelessness and a reduced ability to pay for work-related transportation, both of which would jeopardize an obligor's ability to obtain employment and earn an income. In turn, because payments and parent-child contact time are correlated, inability to pay support could reduce the noncustodial parents' contact with the child, which may be detrimental to child outcomes.

High Orders and Work Disincentives

Some research findings indicate that child support orders that are set too high for low-income obligors may be a disincentive to work and may drive these obligors into the underground economy, where their earnings are not subject to immediate wage withholding to pay child support. The exact extent of this potential problem is not well understood, although it is clear that working in the underground economy is often an option for obligors.

The *Fragile Families and Child Wellbeing Study*,¹¹⁸ which interviewed unmarried fathers shortly after the birth of their children, suggests that 3 in 10 unmarried fathers participate in some underground work activity.¹¹⁹ Most of these fathers combined underground with regular sector work. Only 1.3 percent of fathers worked solely in the irregular sector.

Basic economic theory predicts that some level of effective marginal tax rates produces a disincentive to work. It also makes intuitive sense that if child support orders are set too high and the obligor does not have enough money to live on, he or she may seek work in the underground economy where income is harder to detect and not subject to wage garnishment. Although research on the issue is limited, some studies have found that child support enforcement problems stemming from the inability to pay child support may decrease aboveground work¹²⁰ and drive some obligors into the underground economy.¹²¹ Another research study suggests that high arrears balances substantially reduce both child support payments and formal earnings for fathers.¹²² More research is needed to fully address these issues. For example, one study found

that among fathers initially working in the regular and underground sectors, punitive child support enforcement remedies (e.g., wage garnishment and driver's license suspension) are associated with fewer hours of underground employment.¹²³

Payments, Parent-Child Contact, and Child Outcomes

In addition to depressing rates of child support payment among low-income obligors, high child support order levels may attenuate parent-child relationships. Most research finds a positive correlation between child support payments and father-child contact.¹²⁴ This is an important consideration because research finds that paternal involvement is significantly associated with reduced rates of out-of-wedlock childbearing, high school dropout rates, substance abuse, and juvenile delinquency.¹²⁵

A related issue is the potential impact of high orders on the affordability of decent housing for the noncustodial parent. California has some of the highest housing costs in the nation. The noncustodial parent's access to the children could be jeopardized if he or she does not have adequate income to provide a safe and sanitary place for visitation to take place.

Compliance and the Accumulation of Arrears

Compliance issues arise if the child support order is set too high for low-income noncustodial parents and they do not pay. Various studies analyzing payment data confirm that this does indeed occur.¹²⁶ Further, noncompliance of child support payment leads to the accumulation of arrears. A specific finding from Washington State is that arrears tend to grow when the child support obligation is set above 20 percent of the obligor's earnings.¹²⁷

Nonpayment of child support increases the burden on child support agencies to enforce child support, which is particularly difficult to accomplish with obligors who have little income. The federal Office of Child Support Enforcement (OCSE) reports that over \$100 billion in arrears has accumulated nationwide since the child support program began in 1975.¹²⁸ The same OCSE report forecasts that less than half of the current arrears balance will be collected in the next 10 years and also that any collections will be outpaced by the growth of new arrears. report was prepared for California in 2003.¹²⁹ It found that as of March 2000, California had accumulated \$14 billion in child support arrears, only 25 percent of which would be paid within 10 years, and that the amount of arrears owed statewide would continue to grow. By 2008, almost \$20 billion in arrears were owed in California.¹³⁰ One reason for this continued growth is that California assesses a 10 percent interest rate on arrears owed to the state.

The OCSE report attributes the causes of substantial arrears growth to states' charging interest on arrears and lack of compliance with current child support orders, particularly among obligors with no or low reported income.¹³¹ Similar findings were revealed in the California report.

Recognizing this problem, OCSE has embarked on the "Project to Avoid Increasing Delinquencies" (PAID).¹³² PAID recommends policies to states that will increase collection of current support and prevent and reduce arrears. This includes policies that can be addressed in state child support guidelines, such as setting appropriate orders for parents with a limited ability to pay by providing low-income adjustments to state guideline formulas and attributing income at a reasonable standard for parents whose income information is not available.¹³³

Best Interest of the Child and the Policy Dilemma

The best interest of the children is a common objective when setting public policy. The importance of child support for families and children is well documented. Research suggests that the receipt of child support helps welfare recipients leave welfare for work,¹³⁴ remain off of welfare once they have left¹³⁵ and reduces poverty.¹³⁶ One study showed that child support represented 26 percent of a family's income in those low-income families that receive child support.¹³⁷ In these families, child support was a more important source of income than cash assistance. For those poor children who receive child support but not welfare, child support represented over one-third of their annual family income. Research also shows that child support enforcement has other positive effects on child outcomes, including a positive effect on young children's cognitive development¹³⁸ and educational attainment.¹³⁹ In addition, some evidence

suggests that child support enforcement lowers the rates of out-of-wedlock births and divorces.¹⁴⁰

Still, it is important to note that while child support helps close the poverty gap among children, it cannot alleviate poverty in and of itself. Experts almost universally agree that child support must be coupled with other financial supports to improve the economic security of poor families.¹⁴¹ Determining the appropriate order amount when both the custodial parent and the noncustodial parent have low incomes remains a difficult policy decision. The National Women’s Law Center and the Center for Fathers and Families and Public Policy brought together advocates of low-income mothers and fathers to develop and advance public policy recommendations on child support, including recommendations for child support guidelines.¹⁴² They concluded:

Whatever philosophical statement they [the representatives] thought the guidelines should make about the obligations of each parent and society for the support of children, they recognized that setting awards for low-income noncustodial parents at an unrealistically level is unlikely to produce much additional income, and could be counterproductive.¹⁴³

State Solutions

State solutions to the dilemma of setting child support orders for low-income noncustodial parents center around three major provisions:

- Income attribution policies;
- Thresholds and formulas for applying low-income adjustments; and
- Minimum orders.

Each of these provisions is discussed in more detail below.

Income Imputation/Presumption Policies

All state guidelines use the noncustodial parent’s income to determine the amount of the support award, and most state guidelines also consider the custodial parent’s income as well. Most states attribute income when a parent’s income is unknown, when the parent is voluntarily unemployed or underemployed, and in other situations. In state guidelines that consider both parents’ incomes, income attribution policies apply to both parents equally.

¹⁴² *Ibid.*

¹⁴³ *Id.* at p. 11.

Income is typically deemed to be unknown when the parent does not provide income information as requested in the notification or complaint for support or fails to appear in court and is held in default, and the court or tribunal has no information on which to base the order. Unknown income is more common among noncustodial parents than custodial parents. The custodial parent is typically the party pursuing child support or required to cooperate with the child support agency because he or she is receiving public assistance. The rationale for attributing income when income is unknown is that the court or administrative unit setting support must use some method of income determination; otherwise, the parent would benefit from his or her failure to provide information or appear at the hearing. This is particularly salient for parents working in the underground economy, where income is not recorded or subject to payroll taxes. Because underground income does not show up on state-compiled earnings databases, a major source of income information is unavailable to child support agencies when establishing and enforcing child support orders. Nonetheless, as discussed earlier, the percentage of noncustodial parents who have income only from the underground economy is extremely small, with one study placing it at 1.3 percent.

One of the reasons some parents have low income is that they work in unstable or seasonal employment and have frequent bouts of unemployment. The rationale for attributing income when a parent is unemployed or underemployed is based on the assumption that parents can and should find full-time and/or consistent employment to support their children. This assumption is questionable, given the previously noted fact that the unemployment and underemployment rates in California are 12.5 and 20 percent, respectively, at the time this report was prepared.¹⁴⁴

As discussed earlier, one problem with attributing income to a low-income obligor is that it can result in an order amount beyond what an obligor can reasonably pay because his or her actual income is below the attributed income. In part, this may explain some of the correlation between noncompliance and income attribution. A multistate study of low-income obligors and their payments commencing after order establishment found no payments in almost half (44 percent) of the cases in which income was attributed and in 11 percent of cases in which income was not attributed.¹⁴⁵ The same study found that income was attributed to 45 percent of the low-income obligors, the obligor was unemployed or underemployed in 37 percent of the attributed cases, and the obligor failed to provide income information or to appear at the case conference or court hearing in 46 percent of the attributed cases.

Policy and Experiences of California

The California guideline (Fam. Code, § 4058(b)) provides for income imputation:

¹⁴⁴ Scott, *supra* note 102.

¹⁴⁵ Office of Inspector General, U.S. Dept. of Health and Human Services, *The Establishment of Child Support Orders for Low-Income Noncustodial Parents*, OEI-05-99-00390 (July 2000), p. 16.

The Court may, in its discretion, consider the earning capacity of a parent in lieu of the parent's income, consistent with the best interests of the children.¹⁴⁶

Family Code section 17400(d)(2) (which falls outside the statewide uniform guideline) provides for the presumption of income in DCSS cases when the obligor's income is unknown or no income history is available. This statute provides that income is to be presumed to be the amount of minimum wage for 40 hours per week.

In federal fiscal year 2008, the California DCSS established almost 100,000 child support orders, and more than 6,000 (7 percent) were established through presumed-income assignment.¹⁴⁷ All orders based on presumed income were entered through default; that is, the noncustodial parent did not file an answer or appear at the hearing. DCSS does not track the number of orders with imputed income. Based on the case file data collected for the last California guideline review in 2005, 16 percent of DCSS orders involved either presumed or imputed income.

Seven percent of non-DCSS cases reviewed in 2005 were based on imputed income. No non-DCSS cases were based on presumed income because, according to statute, income can only be presumed in DCSS cases.

Income Attribution in Other State Guidelines

Child support guidelines in the 50 states and the District of Columbia were reviewed and compared to the California guideline as part of this study. The review was limited to state guidelines and did not include consideration of actual practices, other states' statutes, or child support agency policies that may determine income attribution policies. Case law, agency rules, and statutes outside of the guidelines may affect actual income attribution practices more than the income attribution provisions contained in a state's guidelines. For example, even though state guidelines do not always specify unknown income to be attributed as earnings that would result from full-time, minimum wage employment, it is the most common practice across states and jurisdictions.

¹⁴⁶ This guideline review focuses on statutory language in California's Family Code and, more specifically, the Uniform Statewide Guideline (except, of course, throughout discussion on income "presumption" that falls outside the California Family Code language). It does not, as a general matter, focus on the universe of case law that affects application of the guideline. However, for purposes of explaining California's income imputation policy, it is noteworthy to mention that *In re Marriage of Regnery* (1989) 214 Cal.3d 1367 sets out the following three-pronged test to determine whether a court should consider a parent's earning capacity in lieu of his or her actual income: (1) ability to work, including age, occupation, skills, education, health, background, work experience, and qualifications; (2) willingness to work, demonstrated by good faith efforts, due diligence, and actual meaningful attempts to secure employment; and (3) opportunity to work, exemplified by an actual employer willing to hire. The *Regnery* holding additionally clarified that if either the ability or opportunity to work is absent, a parent's earning capacity may not be considered.

¹⁴⁷ Cal. Dept. of Child Support Services, *supra* note 130, table 3.7.

The term “attributed income” is used loosely in this discussion to mean any provision that allows an income amount other than the parent’s actual income to be used to calculate the support award. State guidelines use the terms “attributed income,” “imputed income,” “presumed income,” and “potential income.” Not all states use more than one term and each term is defined differently from state to state. The delineation of “imputed” and “presumed” income is unique to California. No other state guidelines distinguish between income attribution because income is unknown and income attribution for other reasons. In fact, only 14 state guidelines specifically mention that income is to be attributed when income is unknown.

About half of the state guidelines (26 states) specify a floor for income attribution or an amount to be used when income is unknown. The most common amount is the state or federal minimum wage, but three states specify a higher amount. The Minnesota guideline specifies 150 percent of the federal minimum wage, the Tennessee guideline specifies state median wage, and Vermont specifies 150 percent of the average state wage.

A smaller number of state guidelines (19 states) specify the number of hours worked to be considered in income attribution. With the exceptions of Hawaii, Montana, and Wisconsin, most specify full-time or 40 hours per week. Hawaii specifies 30 hours per week or less, Montana specifies a work schedule that averages 25 hours per week for students, and Wisconsin specifies 35 hours per week.

Almost half of the state guidelines (22 states) provide for consideration of local employment opportunities or prevailing wage rates when attributing income. This allows for attribution at more realistic levels, particularly in communities with few job opportunities or recent job losses, which has become more common during the current economic recession. Most of these state guidelines, however, also provide for the consideration of the parent’s employment history, education attainment, employment qualifications, or a combination of these factors in the determination of the amount of attributed income. In all, 30 state guidelines specify that one or more of these factors should be considered.

Other considerations frequently specified in the guidelines are whether unemployment or underemployment is voluntary (34 state guidelines) and whether the parent is mentally or physically incapacitated (24 state guidelines). Several state guidelines identify circumstances in which income should not be attributed. The most common of these limiting circumstances are the parent’s mental or physical disability (24 state guidelines) or the parent’s need to care for a young child or another person with special needs (23 state guidelines). Some state guidelines limit a child support obligation when the parent is trying to improve his or her qualifications by advancing his or her education (9 state guidelines) or is incarcerated (5 state guidelines). Four states limit the amount of a child support obligation where the unemployed noncustodial parent is making a reasonable effort to find employment. Only one state’s guidelines (Indiana) recognize a distinction between voluntary and involuntary unemployment.¹⁴⁸

¹⁴⁸ It is worth noting, however, that extensive California case law provides guidance on distinguishing between voluntary and involuntary unemployment.

The California guideline does not specifically mention any of these considerations, a pattern that is replicated in only a few other states. Most state guidelines contain several considerations in their income attribution provision. The Alabama guideline contains an income attribution provision more representative of other state guidelines in length, breadth, and scope than that of California:

If the court finds that either parent is voluntarily unemployed or underemployed, it shall estimate the income that parent would otherwise have and shall impute to that parent that income; the court shall calculate child support based on that parent's imputed income. In determining the amount of income to be imputed to a parent who is unemployed or underemployed, the court should determine the employment potential and probable earning level of that parent, based on that parent's recent work history, education, and occupational qualifications, and on the prevailing job opportunities and earning levels in the community. The court may take into account the presence of a young or physically or mentally disabled child necessitating the parent's need to stay in the home and therefore the inability to work.

(Ala. Rules Jud. Admin., rule 32(B)(5).)

Comparison of State Guidelines Regarding Unknown Income

Exhibit 4-1 compares each state's guideline amount under four different scenarios. These amounts were calculated for this report using each state's guideline and, when available, an automated calculator sponsored by the state's child support agency or court. More information about the sources and underlying assumptions of these calculations is provided in Appendix C.

- In Case A, the noncustodial parent's income is unknown, the custodial parent's income is zero, and there is one child. In this case, the income presumption policy of a state's guideline is the basis for calculating the noncustodial parent's income. If the state's guideline (or statute in California) does not specify the amount of income to be presumed, the state's minimum wage is used. If a state's guideline does not specify the hours worked in the provision, a 40-hour workweek is used.
- Case B is similar to Case A except for one difference. It assumes that the noncustodial parent works 40 hours per week at the current federal minimum wage of \$7.25 per hour. In other words, there is no variation among states in the calculation of the noncustodial parent's income based on differences in state provisions for income presumption, state minimum wage, or both. Other assumptions of Case A and Case B are identical—that is, the custodial parent's income is zero and there is one child.
- Case C also assumes that the noncustodial parent works full-time at federal minimum wage. However, Case C considers the guideline amount for two children, rather than one child, as in Case B.
- Case D also assumes that the noncustodial parent works full-time at federal minimum wage. Case D considers the guideline amount for five children.

The purpose of Case A is to compare state guidelines when the noncustodial parent's income is unknown. In effect, it not only captures differences in state guidelines formulas but also state differences in income presumption policy and minimum wage levels among states that establish a minimum wage above the federal level. The purpose of Case B is to compare state guidelines using the same amount of income; specifically, income equivalent to full-time, federal minimum wage earnings, which is the most common amount presumed. Comparisons of the guideline amounts using Case A and Case B highlight state differences that result from a state guideline that presumes income at an amount other than full-time, federal minimum wage and those states that have a state minimum wage that is higher than the federal minimum wage. The purpose of comparing Cases C and D is to observe how state guidelines vary in their treatment of cases with more than one child. Based on California's last guideline review, 61 percent of child support orders cover one child, 30 percent cover two children, 7 percent cover three children, and 2 percent cover four or more children.

State Comparisons—Case A: In this scenario, the noncustodial parent's income varies among states in accordance with income presumption provisions set in state statute, the state's minimum wage, or both. California Family Code section 17400(d)(2) provides that income will be presumed at full-time, minimum wage earnings in California (\$8 per hour). This results in a monthly gross income of \$1,386 per month. The California guideline amount for Case A is \$300 per month. This is the eighth highest amount among the 50 states and the District of Columbia. The states with the three highest guidelines amounts for this case (Minnesota, Tennessee, and Vermont) all presume income at amounts considerably higher than full-time, minimum wage earnings when income is unknown. The amounts in these states range from more than \$400 to almost \$800 per month. Oregon and Washington guidelines produce amounts that are higher than California's because these states also have state minimum wages that exceed the California minimum wage. States with the lowest guidelines amounts for this scenario include Alaska, District of Columbia, and Delaware. The guidelines amounts for these states are \$50 per month or less because these state guidelines have low-income adjustments that consider the current federal poverty level or similar data. Low-income adjustments are discussed in the next section of this report.

State Comparisons—Case B: As evident in the state comparisons based on Case A, which compared state guidelines amounts when obligor income was presumed, some states have higher guideline amounts because they presume a higher amount of parental income when income is unknown. To control for this, Case B assumes that the obligor's income is \$1,256 gross per month, which is equivalent to full-time earnings at the current federal minimum wage of \$7.25 per hour, but the other assumptions remain the same (i.e., the obligee has no income and there is one child). The California guideline amount for Case B is \$236 per month. California ranks 24th among states for this scenario, which is close to the national average. Although using the federal minimum wage is not a realistic scenario for California because its minimum wage is higher, it does demonstrate that part of the reason the California guideline ranks high for Case A is that the state's minimum wage exceeds the federal amount.

State Comparisons—Cases C and D: Cases C and D involve two and five children, respectively, rather than one child, as does Cases A and B. Otherwise, it makes the same assumptions as Case B: the obligor works full-time at the federal minimum wage and the obligee has no income. The purpose of this scenario is to demonstrate that the California formula for low-income obligors with two or more children may be too high relative to the formulas of other states. This is because of the way the low-income adjustment phases into the guidelines amounts based on measurements of child-rearing expenditures and the phase-out varies with the number of children. The total amount expended on children increases when there are more children. Low-income obligors with more children face higher orders when the guideline amounts are based on child-rearing costs than those with fewer children. Under Case C, which involves two children, the California guideline amount is \$377 per month, which is 13th highest in the nation. California's ranking is even higher for Case D, which involves five children. Under this scenario, the California guideline is \$589 per month, which is fifth highest in the nation. As previously noted, California ranked 24th among states when there was only one child at an identical income level.

Exhibit 4-1. Comparison of States' Guidelines' Amounts When Income Is Presumed at or Equivalent to Full-Time, Minimum Wage

^a Appendix C contains the amount of presumed income used by each state. The amount varies according to each state's guideline, the state minimum wage, or both.

Low-Income Adjustments: Thresholds and Formulas

The majority of states include some sort of adjustment for low-income obligors—that is, at low income levels, the guidelines reduce order levels to amounts that fall below the actual cost of raising children. The California guideline applies its low-income adjustment only to incomes that fall below \$1,000 net per month. In contrast, most states do not have a set threshold for applying their low-income adjustment. Instead, most state guidelines gradually phase out the low-income adjustment to amounts that reflect child-rearing costs. In these states, the income at which the low-income adjustment phases out typically varies by the number of children because the costs of child rearing increase when there are more children. For example, North Carolina phases out its low-income adjustment at \$1,300 gross per month for one child and \$2,550 gross per month for six children.

California does not vary the low-income adjustment threshold for the number of children and has never updated this threshold since it was first adopted. The income threshold has remained at \$1,000 net per month for over a decade in California. The only change occurred in 2003, when the California Legislature made the low-income adjustment presumptive. Prior to then, the low-income adjustment was applied at court discretion and so was not applied consistently across the state.

Because the adjustment is applied to incomes below \$1,000, the California guideline does not protect obligors with incomes just above this threshold from being impoverished by their child support orders. This was illustrated in an earlier case scenario. It showed that application of the current California guideline would result in a \$300 per month order for one child when an obligor works full-time at the state minimum wage (\$1,386 gross per month). At this wage, the obligor's after-tax income is \$1,200 per month, so paying \$300 per month in child support leaves the obligor with \$900 per month in spendable income. This is below the current federal poverty level for one person (\$902.50) per month. As long as the threshold for applying the low-income adjustment remains at \$1,000, the gap between obligor's spendable income and the poverty level will continue to grow because the federal poverty level is updated annually. Future increases in the state minimum wage will also widen the gap for those obligors working at minimum wage or in cases where the obligor's income is presumed.

The formula used to adjust for low incomes in California is unique. Unlike most low-income adjustments in state guidelines, the California low-income adjustment does not consider how much income the obligor needs to live above a subsistence level. The California low-income

adjustment is simply a percentage reduction to the regular guideline amount. Most state guidelines (30 states) rely on a “self-support reserve” as the underlying basis of their low-income adjustment. The self-support reserve is typically based on the federal poverty level for one person. It represents the amount of spendable income after payment of taxes and child support that the obligor needs in order to live at least at subsistence level. Since most states incorporate the adjustment into their child support look-up tables, its existence is not readily apparent. Some states (e.g., District of Columbia, New York, Vermont, West Virginia), however, incorporate the adjustment into their child support worksheet. This makes the adjustment transparent.

Exhibit 4-2 illustrates how a low-income adjustment based on the self-support reserve is incorporated into the New York guidelines. The New York guideline formula is 17 percent of the obligor’s adjusted gross income for one child. Unlike California’s guideline, the New York guideline does not effectively consider the obligee’s income in the base calculation or the child’s time with each parent. For an obligor with gross income of \$1,386 per month (\$1,286 per month after income adjustments permissible under the New York guideline), the preliminary child support order—that is, the amount prior to the low-income adjustment—would be \$218 per month for one child in New York. The New York guideline provides for a self-support reserve equivalent to 135 percent of the federal poverty level for one person. Based on the most current poverty level (2009), this equates to a self-support reserve of \$1,218 per month. The difference between the income used to determine support (\$1,280 per month) and the self-support reserve is \$62 per month. An obligor paying a child support order of this amount has sufficient income to meet his or her self-support reserve. Because this amount (\$62 per month, as shown on line 6 of Exhibit 4-2) is less than the regular guideline calculation (\$218, as shown on line 4 of Exhibit 4-2), the order is set at \$62 per month for this case.

Exhibit 4-2. Illustration of New York’s Self-Support Reserve Test	
1. Obligor’s gross income	\$1,386
2. Adjustments to gross income	106
3. Income available for support (line 1 minus line 2)	1,280
4. Preliminary child support order (line 3 multiplied by 17% for one child)	218
Self-Support Reserve Test	
5. Self-support (135% of the federal poverty level for one person)	1,218
6. Income available for support (line 3 minus line 5)	62
7. Child support order (the lesser of lines 4 and 6)	\$ 62

The amount of the self-support reserve varies considerably among states. Most self-support reserve amounts are based on whatever the federal poverty level for one person was in the year when the state last updated its guideline. This means that states that have not updated their guidelines for several years have self-support reserves as low as about \$450 per month, which approximates the federal poverty level for one person in 1989. Some state guidelines (i.e., District of Columbia, Minnesota, New York, Washington) avoid this problem by indexing their self-support reserve to the federal poverty level for one person, which is updated by April of each year. These states also inflate the federal poverty level by 20, 33, 35, and 50 percent when using it as a self-support reserve.

There are several reasons for using an index of poverty for the self-support reserve that exceeds the federal poverty level. The federal poverty level is often criticized for being an inadequate measure of poverty. Income eligibility thresholds for public assistance programs are often set above 100 percent (e.g., SNAP—formerly called Food Stamps—is set at 130 percent of the poverty level, and C-CHIP (California Child Health Insurance Program) eligibility is set at 300 percent of the poverty level). Following this logic, it would make sense to match the index for the self-support reserve for noncustodial parents to the index used for custodial parents applying for welfare. Still another reason for inflating the federal poverty level in a self-support reserve is to take taxes into account. Since some states guidelines rely on gross income while the poverty level is expressed as an after-tax income amount, the inflator essentially accounts for tax consequences.

The merits of the self-support reserve test as a low-income adjustment are that it considers the subsistence needs of the obligor; it is based on a logical, easily understood premise; it can be made transparent when it is put in the worksheet (as illustrated in Exhibit 4-2); and when indexed to the federal poverty level, it can be updated annually. The major limitation is that it typically produces a lower order amount than does a proportional adjustment, which is the next common method used by states, or an equalization of income, which is used by a few states to adjust for low income. Some advocates perceive any lowering of support as an unacceptable detriment to the child.

Minimum Orders

About 40 state guidelines impose minimum orders. California and 10 other state guidelines do not. Most state guidelines with low-income adjustments based on a self-support reserve also have minimum orders. Without a minimum order, it is possible for the self-support reserve test to result in a negative order amount, specifically for incomes below or just above the self-support reserve amount.

The most common minimum order amount is \$50 per month. Some state guidelines set minimums as low as \$10 per month (e.g., Maine), while other state guidelines rely on a minimum order of over \$200 per month (e.g., South Dakota). Many states vary the minimum order with the number of children. A few states (e.g., Maryland) provide a range as the minimum order (\$20 to \$150 per month) for incomes below the federal poverty level or minimum wage. The merit of a range is that it allows for some variation based on the obligor's income or the circumstances of the case. It is particularly useful when it applies to a wide range of incomes below full-time, minimum wage earnings because it allows for some variations in cases where the obligor does not have the capacity or ability to work at least full-time at minimum wage. An obligor with \$550 per month in disability benefits can be treated differently than an obligor with unemployment benefits of \$800 per month. The limitations of establishing a range are that the order amounts are not predictable for obligors with incomes in that range, and it may result in inconsistent amounts in similarly situated cases.

The merit of imposing a minimum order is that it establishes the precedent that all parents at all income levels are financially responsible for their children. One limitation is that there are some situations where a zero order may be more appropriate. For example, a zero order may be more appropriate for an obligor who is institutionalized for several years and has no income-producing assets. Some states (e.g., Indiana) have devised guidelines that provide for minimum orders but also provide for a zero order when appropriate. Indiana's provision follows.

When a parent has extremely low income the amount of child support recommended by use of the Guidelines should be carefully scrutinized. The court should consider the obligor's income and living expenses to determine the maximum amount of child support that can reasonably be ordered without denying the obligor the means for self-support at a minimum subsistence level. The court may consider \$12.00 as a minimum child support order; however, there are situations where a \$0.00 support order is appropriate. A numeric amount of child support shall be ordered.

(Ind. Child Support Rules and Guidelines 2.)

Indiana clarifies in its commentary that a minimal or a zero-dollar child support order may be appropriate in some situations.

[T]he Guidelines do not establish a minimum support obligation. Instead the facts of each individual case must be examined and support set in such a manner that the obligor is not denied a means of self-support at a subsistence level. For example, (1) a parent who has a high parenting time credit, (2) a parent who suffers from mental illness, (3) a parent caring for a disabled child, (4) an incarcerated parent, (5) a parent or a family member with a significant/chronic health issue, or (6) a natural disaster are significant but not exclusive factors for the Court to consider in setting a child support order. The court should not automatically attribute minimum wage to parents who, for a variety of factors, are not capable of earning minimum wage.

(Ind. Child Support Rules and Guidelines 2.)

Chapter Summary

Low-income adjustments in state guidelines are completely justifiable and often appropriate. They are fair to the obligor because they consider his or her subsistence needs, result in orders that more realistically reflect an ability to pay, and preserve the incentive to work. According to the literature, orders that comprise an excessive proportion of obligor income result in lower compliance rates, higher arrears balances, and increases in underground employment. Arguably, low-income adjustments are also in the best interest of the child because setting realistic child support orders retains a noncustodial parent's incentive to work in the regular economy and

keeps the noncustodial parent involved with the child.¹⁴⁹ The literature amply documents that parent-child involvement and child support receipt are associated with many desirable child outcomes.

Thirty states have adopted a “self-support reserve” as their low-income adjustment to their guidelines. Based on the federal poverty level, it represents the amount of spendable income after payment of taxes and child support that the obligor needs in order to live at least at a subsistence level. Several states index their self-support reserve to the federal poverty level for one person, which is updated annually. They also inflate the federal poverty level by 20 to 50 percent to obtain a better measure of poverty, match the income eligibility thresholds for public assistance programs, and account for taxes.

The current California low-income adjustment is inadequate. Established more than 10 years ago, it is out of date, and, unlike most state guidelines, it does not consider the subsistence needs of the obligor. A comparison of order amounts for low-income obligors with one child when the obligor’s income must be imputed or presumed ranks California eighth highest among the 50 states and District of Columbia. In a comparison using federal minimum wage rates, minimum wage earners in California fare worse than most of their counterparts in other states. These California minimum wage earners rank 13th highest in order levels with two children and 5th highest in order levels with five children. Indeed, the only scenario where minimum wage earners in California do about as well as their counterparts in other states is when they have a single child and their income is based on the federal minimum wage level.

California’s income imputation and presumption policies only exacerbate the issue of establishing appropriate guideline amounts for low-income obligors. Although most states provide for income attribution in their child support guidelines, income attribution produces order amounts that exceed what an obligor can reasonably pay largely because the attributed amount is more than the obligor’s actual income. Obligor with little available income information, work history, or evidence of employment qualifications are presumed to be able to obtain full-time employment and earn the minimum wage. While this presumption is questionable in the best of economic circumstances, there is absolutely no basis for it in a time when employment in California has dropped for 40 consecutive months, unemployment stands at 12.5 percent, and underemployment has reached 20 percent. The barriers to full-time employment are even worse for the high proportions of Hispanic and African-American noncustodial parents in the IV-D system, whose national unemployment rates are 12.6 and 16.5 percent, respectively.

It is relevant to note that California law uniquely provides for attribution of income both within the guideline and outside the guideline in DCSS cases. Indeed, the guideline review found that approximately 16 percent of child support orders in IV-D cases are based on either presumed or imputed income, as compared with 7 percent in non-DCSS cases. Generating orders that better

¹⁴⁹ There are some obvious situations, such as cases involving domestic violence, that create exceptions.

reflect the true earning potential of low-income obligors in the child support system will not be achieved through adjustment of the state guideline alone. Rather, it will require coordination between the low-income adjustment in the formula, as well as provision for income presumption contained in the non-guideline statute. This recommendation and others pertaining to low-income families are contained in the recommendation chapter of this report.

CHAPTER 5

Medical Support Provisions

This chapter addresses state provisions for the establishment of medical support, specifically provisions that meet federal medical support requirements imposed in 2008 and currently in effect.¹⁵⁰ Medical support can require several different things: health insurance coverage for the child by one or both of the parents; a specification as to how the parents will handle and pay for the child's uninsured health-care expenses (including copays and deductibles); an amount to offset coverage costs when the children are enrolled in Medicaid or another public entity program; or a combination of these. Most states, including California, provide for the children's medical support within the child support order. Only a couple of states routinely provide separate orders for child support and medical support.¹⁵¹

Medical support is a current issue for two reasons. In response to recent health-care trends and in recognition of the child's health-care needs, in 2008 the federal government vastly expanded its medical support requirements applying to states.¹⁵² These federal requirements involve the implementation of extremely complex policies, such that many states, including California, are still in the process of making conforming changes.¹⁵³ National health reform adopted into law in 2010 even further compounds this complexity. Some policy leaders believe health reform will eventually produce changes to federal medical support requirements, but it is still too early to know how.¹⁵⁴ Health reform did not directly address child medical support, so any changes necessary to make federal medical support congruent with health reform measures will take time to identify and develop. In the interim, states have made or are making minimum changes to comply with the 2008 federal requirements.

Most of the existing federal medical support requirements apply to the state IV-D caseload. Only a few requirements apply to state guidelines, which must be used by both IV-D and non-IV-D cases because the guidelines must be applied to all cases. Most states provide for medical support in two places: their child support guidelines and a non-guidelines section of their state statute. Typically, states provide for the medical support specific to the IV-D agency in the non-guidelines section of state statute. California applies medical support in both guidelines and non-guidelines sections of its statutes; however, the non-guidelines section also applies to non-IV-D cases. The California guideline contains medical support provisions at Family Code section 4062(a)(2), and another Family Code section, section 3751(a)(2), also provides for medical

¹⁵⁰ 73 Fed.Reg. 42416–42442 (July 21, 2008), <http://www.acf.hhs.gov/programs/cse/pol/AT/2008/at-08-08.htm>.

¹⁵¹ The consequence of two orders is important to child support enforcement. Enforcement remedies available to state IV-D agencies cannot always be used if there is a separate order for medical support.

¹⁵² 73 Fed.Reg. 42416–42442.

¹⁵³ For the most part, the California guideline and other statutes already comply with these 2008 requirements; the only exception is the requirement for a quantitative threshold for defining the reasonable cost of the child's medical support. However, proposed Senate Bill 580 (Wright) proposes this threshold and definition.

¹⁵⁴ Vicki Turetsky, "Health Reform for Children Is on the Horizon" (Jan.2010) 32(1) *Child Support Report*, www.acf.hhs.gov/programs/cse/pubs/2010/csr/csr1001.pdf.

support. In all, there is little consistency among states regarding which provisions pertaining to the establishment of medical support are contained in a state's guidelines and which provisions are contained in non-guideline statute. This means that any discussion about state provisions affecting the ordering of medical support cannot be limited to a discussion of state guidelines.

This chapter discusses state provisions affecting the ordering of medical support. It focuses on the 2008 medical support requirements issued by the federal Office of Child Support Enforcement (OCSE) that are currently in effect. It begins with some background statistics on medical support. The likely impact of 2010 health reform is interjected when appropriate.

Background Statistics on Medical Support

As identified earlier, medical support orders can require one or both parents to provide health insurance coverage; specify how the parents will handle and pay for the child's uninsured health-care expenses; specify an amount to offset coverage costs when the child is enrolled in Medicaid or a similar program; or a combination of these.

Federal regulations require state IV-D agencies to pursue medical support. Most child support orders established or enforced by state IV-D agencies contain an order for medical support. Nationally there are more than 12 million open IV-D cases with support orders, more than 1 million in California alone.¹⁵⁵ Nationally, medical support is ordered in 77 percent of these cases.¹⁵⁶ California has established medical support orders at an even higher rate. Medical support is ordered in 90 percent of California IV-D cases with established support orders.¹⁵⁷

Most medical support orders nationally and in California include, at a minimum, an order for a parent to provide health insurance, typically through the parent's employer. Orders requiring that at least one parent provide health insurance for the child comprise 88 percent of IV-D medical support orders nationally and almost 100 percent of IV-D medical support orders in California.¹⁵⁸ A typical approach taken by most states consists of ordering each parent to carry health insurance for the child if the parent has insurance available at a reasonable cost even though the parent may not have access to insurance at the time the order is entered. This approach allows the IV-D agency to take measures to enroll the child in a health plan quickly if one becomes available—for example, when a parent obtains new employment with health benefits.

Nonetheless, as discussed in more detail later, ordering parents to provide health insurance does not always mean it is provided, particularly in IV-D cases, where most parents are low income and few have access to employer-provided health-care benefits.

The case file review, which was presented in an earlier Chapter 3, found that 18 percent of California child support orders include an order for uninsured health-care costs. The comparative national statistic is not tracked. The number of medical support orders that offset coverage costs when the children are enrolled in Medicaid or a similar program is also unknown nationally. Like most states, California does not routinely order medical support in Medicaid cases that is to be collected and distributed to the Medicaid agency to offset the cost of the child's coverage.

National data tracking of IV-D cases in 2008 finds that health insurance is provided as ordered in just 30 percent of IV-D cases with orders and that medical support is provided as ordered among 28 percent of the same set of cases.¹⁵⁹ The same data source provides state-specific data. It shows that health insurance is provided as ordered in 39 percent of California IV-D cases with orders and that medical support is provided as ordered in 21 percent of California IV-D cases with orders. One barrier to ordering medical support as well as medical support compliance in IV-D cases is that parents are generally low income and lack access to affordable, private health-care coverage.

In general, various studies find that children, particularly children in the IV-D caseload, do not typically have health-care coverage provided through employer-sponsored insurance available to the obligor.¹⁶⁰ The only study known to track medical support in both IV-D and non-IV-D cases dates back to a 1999 survey of child support-eligible children living with their mothers.¹⁶¹ Unlike the IV-D statistics on medical support provided earlier that considered the percentage of *ordered* cases with coverage, this 1999 study included children with and without medical support orders. The study found that half had health-care coverage through employer-sponsored insurance, but the custodial mother was typically the source of the child's health-care coverage rather than the noncustodial father.¹⁶² Specifically, the custodial mother or stepfather was the source of employer-sponsored insurance for 32 percent of the children; the noncustodial father

¹⁵⁹ Office of Child Support Enforcement, *supra* note 155 tables 11 and 12.

¹⁶¹ This study explicitly considered custodial mothers, so using the term "mothers" here is appropriate. As discussed earlier, "obligor" and "obligee" are generally used throughout this report because they are consistent with the California guideline. However, when referencing specific sources that use "mother" and "father" or "custodial" and "noncustodial" parent, those terms are adapted. In addition, "custodial" and "noncustodial" are used when discussing other programs (e.g., Medicaid) where the income of the custodial parent household is considered to determine eligibility. This nuance is important because, under the California guideline, it is possible for the custodial parent to be the obligor if the custodial parent has considerably more income than the noncustodial parent and physical responsibility for the child is equally shared or almost equally shared.

¹⁶² Aron, *supra* note 160, table 4.

was the source of employer-sponsored insurance for 13 percent of the children; and the source of the employer-sponsored insurance was unknown or from another source for 5 percent of the children. Among children without employer-sponsored insurance, the same 1999 study found that 33 percent of child support–eligible children were enrolled in Medicaid or CHIP, 14 percent of the children were uninsured, and 3 percent had other insurance.

Many children in the IV-D caseload qualify for Medicaid or CHIP, and at least 60 percent used Medicaid or CHIP in 2005.¹⁶³ Medical support is known to significantly reduce Medicaid costs through third-party liabilities and cash medical support orders. Third-party reimbursements are realized because children can be simultaneously enrolled in Medicaid, based on the income of the custodial parent, and the noncustodial parent’s employer-sponsored insurance plan pursuant to a medical support order. Although many custodial parents prefer Medicaid coverage over private or dual coverage because it has more comprehensive benefits, lacks copays or deductibles, and is generally more convenient,¹⁶⁴ health-care expenses incurred under Medicaid can be recovered through the noncustodial parent’s health insurance plan for children with dual coverage. This is also known as third-party liabilities and, historically, is the major thrust of child medical support efforts by IV-D agencies. Texas, the only state besides California to have a IV-D caseload exceeding 1 million, recovered \$36 million in 2006 from insurance carriers, medical providers, and pharmaceutical companies.¹⁶⁵ All state IV-D and Medicaid agencies must collaborate to collect third-party liabilities from their overlapping caseloads. The current amount collected nationally or in California is unknown, but several other states report substantial savings. For example, Wisconsin, a state with about 350,000 IV-D cases, estimates that it saves \$500,000 per month in third-party liabilities for IV-D children who have dual coverage through Wisconsin’s Medicaid program and the noncustodial parent’s private insurance.¹⁶⁶

Another way that medical support reduces Medicaid costs is through orders for cash medical support that is collected and disbursed to the Medicaid agency to offset the child’s health-care coverage. These types of orders will generally work only when Medicaid is provided through managed-care organizations that assess a monthly amount for the child’s health-care coverage. They do not work well where Medicaid is delivered by fee-for-service because the Medicaid agency cannot receive cash medical support that exceeds the medical fees incurred for a particular child.¹⁶⁷ California delivers its child Medicaid services through both managed care and fee-for-service.¹⁶⁸ Fee-for-service is more likely in rural areas, where the market for managed care is smaller than in urban settings.

¹⁶⁷ 73 Fed.Reg. at 42422–42423.

¹⁶⁸ Kaiser Family Foundation, “California: Medicaid Managed Care,” <http://statehealthfacts.org>.

Most states, including California, do not solely provide their child Medicaid program through managed care. For this and several other reasons, only a few states assess and collect this type of cash medical support. Texas is one state that does. In 2006, Texas collected \$15 million in cash medical support that was disbursed directly to the Medicaid agency to offset the child's health-care coverage.¹⁶⁹ Texas typically tacks cash medical support on top of base child support.

A federal study of eight states also suggests that Medicaid savings of both federal and state dollars from this type of medical support could be large.¹⁷⁰ Conducted in 2005 to explore ways to deal with shrinking Medicaid budgets, the federal study estimated that noncustodial parents could contribute \$99 million annually to the Medicaid costs incurred by IV-D children in the study states.

Some state IV-D demonstration projects have found that medical support efforts yield only modest impacts for Medicaid third-party reimbursements and children's health care coverage. For example, a Washington demonstration project that tested the efficacy of a centralized medical support unit found that third-party medical support was being provided as ordered in 16 percent of the reviewed cases.¹⁷¹ Where medical support was not provided, the majority of noncustodial parents were unemployed, incarcerated, or employed in a setting that either lacked employer-sponsored health benefits or were unavailable at a reasonable cost.¹⁷² This result is consistent with the discussion in Chapter 4 regarding the poverty level of a large proportion of individuals in IV-D cases. Poor and low-income individuals are unlikely to have employer-sponsored health benefits. Still another reason that child medical support does not have a relatively large impact on Medicaid cases is that not all Medicaid children are in the IV-D caseload. For example, a Vermont demonstration project found private health insurance for 17 percent of Medicaid children in its IV-D caseload. Because not all Vermont children enrolled in Medicaid are in the IV-D caseload, this amounted to the IV-D agency finding health insurance for 10 percent of its statewide Medicaid population.¹⁷³

¹⁷² The Sacramento County IV-D program implemented an innovative solution in 1990 to overcome the lack of employer-sponsored insurance available to obligors. (At the time, federal regulations required that the IV-D agency petition the obligor for the children's health insurance if the obligor had employer-sponsored insurance, and they did not require the consideration of insurance available to both parents.) Sacramento teamed with a third-party administrator and two insurance carriers to make child-only health insurance available in selected IV-D cases. The premiums (around the year 2003) were about \$100 per month per child. This insurance is typically ordered in Medicaid cases and in cases where the premium can be withheld from the obligor's paycheck. Center for Policy Research, *supra* note 164.

¹⁷³ Vermont Office of Child Support, *supra* note 160.

Federal Requirements

State guidelines have been required to provide for “the children’s health care needs through health insurance coverage or other means”¹⁷⁴ since 1987, when guidelines were first required by the federal government. In 2008, OCSE issued new rules that imposed the following medical support requirements.¹⁷⁵ States vary as to whether they meet these requirements in their guidelines or the non-guidelines provision of their statutes.

- In addition to the previous requirements, state guidelines must address how parents will provide for the child’s health-care needs.
- States must allow for either or both parents to be ordered to provide medical support.
- States must specify a quantitative threshold for determining whether medical support is reasonable in cost. The reasonable-cost test must be applied only to the child’s premium.
- States must provide a definition of “accessible” insurance.
- States must allow for “cash medical support.”

Each of these provisions is separately discussed in more detail. As part of the consideration of both parents’ access to insurance, researchers for this project considered how state guidelines adjust for a parent’s expense of the child’s insurance premium. The discussion on reasonable cost also considers the costs of a child’s health-care.

Providing for the Child’s Health-Care Needs

The new medical support rules expanded federal requirements. State guidelines must:

Address how the parents will provide for the child(ren)’s health care needs through health insurance coverage and/or through cash medical support in accordance with § 303.31 of this chapter.

(45 C.F.R. § 302.56(3).)

This provision essentially requires that a state guideline complement the federal requirement (45 C.F.R. § 303.31) of state IV-D agencies—that is, agencies must petition for medical support in IV-D cases, and a state must allow for the provision of medical support in the child support order. This includes the jurisdiction to order a parent to enroll the child in private health insurance or cash medical support, or both.

For most states, the guideline provides for the ordering of medical support. California and 11 other states provide the jurisdiction to order medical support outside the state guidelines. The California provision requiring health insurance coverage for the children, as shown below, is outside the child support guideline but it is still contained in the Family Code:

¹⁷⁴ Child Support Enforcement Amendments of 1984 (Pub. L. No. 98-378, 98 Stat. 1305).

¹⁷⁵ 73 Fed.Reg. 42416–42442.

In any case in which an amount is set for current support, the court shall require that health insurance coverage for a supported child shall be maintained by either or both parents if that insurance is available at no cost or at reasonable cost to the parent.

(Fam. Code, § 3751(a)(2).)

However, the California provision for uninsured medical expenses is provided in the child support guideline.

The court shall order the following as additional child support: . . . (2) The reasonable uninsured health care costs for the children as provided in Section 4063.

(*Id.*, § 4062(a)(2).)

In contrast, some states provide for the child's health insurance and uninsured medical expenses in the same place. The Nebraska guideline exemplifies this:

The child support order shall address how the parents will provide for the child(ren)'s health care needs through health insurance as well as the nonreimbursed reasonable and necessary child(ren)'s health care costs that are not included in [the child support schedule].

(Neb. Rev. Court Rules, ch. 4, art. 2, § 4-215.)

Ordering Either or Both Parents to Provide Medical Support

The new federal rules eliminated the longstanding presumption in federal child support policy that the noncustodial parent had employer-sponsored insurance available to cover his or her children and that it would be the most appropriate source of health-care coverage for his or her children. The new rules recognize that there is no rational basis for assuming that the noncustodial parent is more likely than the custodial parent to have employer-sponsored insurance; that the number of employers providing health benefits is declining; that premium costs are escalating and families are assuming larger deductibles, copays, and other out-of-pocket health-care expenses; that more health plans limit the geographical area that they serve; and that more employers impose a waiting period before enrolling an employee and his or her family.

The new federal rules require that the insurance available to both parents be considered for medical support. Most states, including California, at Family Code section 3751(a)(2), already provide for orders for insurance that apply to either or both parents. What is different is how states must now evaluate which insurance is most appropriate for the child in IV-D cases. The new federal rules require an evaluation of which insurance is the most appropriate for the child in IV-D cases based on state-determined definitions of reasonable cost and accessible insurance.¹⁷⁶

¹⁷⁶ 45 C.F.R. § 303.31(2).

Some states (e.g., New Jersey, Oklahoma) have developed analytical tools, like elaborate hierarchies and decision-making matrices, to determine which parent has accessible insurance that is reasonable in cost, whether both parents have accessible insurance that is reasonable in cost, and so forth.¹⁷⁷ It is not entirely clear whether these analytical tools are used in both IV-D and non-IV-D cases, but the federal regulations require an evaluation only in IV-D cases. Specifically, the IV-D agency is federally required to petition for medical support. The federal requirement prioritizes private insurance available to either parent over Medicaid as long as it is reasonable in cost and accessible to the child.

The reality is, however, that the opportunities to use these tools are limited because IV-D cases where both parents have access to private insurance are rare. Instead, as identified earlier, the more common situations in IV-D cases are that the children are enrolled in Medicaid and that few IV-D parents have employer-sponsored insurance.¹⁷⁸ Various detailed studies from other states also indicate that few noncustodial parents in IV-D cases have access to employer-sponsored insurance. A Colorado study that aimed to increase medical support coverage in new orders found that the noncustodial parent had access to employer-sponsored insurance in only 1 out of 10 IV-D establishment cases.¹⁷⁹ A Vermont study tracking all IV-D medical support results over 10 months found the incidence of noncustodial parents with accessible insurance somewhat more frequent but still uncommon, with only 25 percent having access to employer-sponsored insurance.¹⁸⁰

Even though the current federal medical support rules require it, consideration of both parents' access to employer-sponsored insurance may be an outdated standard in light of 2010 health reform measures that, once effective, will mandate individual health-care coverage and impose tax penalties for failure to provide coverage.¹⁸¹ Although this is not explicitly stated by OCSE as a reason, OCSE is carefully reviewing federal medical support rules in light of health reform and publically announcing that medical support rules may change in the future. Specifically, to be consistent with the new health-care mandate, which becomes effective in 2013 and extends to the dependents of an individual, it might make more sense if the requirement was for the parent who must pay penalties for noncoverage to be the parent who must provide coverage, rather than the existing requirement to consider both parents' access to insurance. The custodial parent would play both of these roles in many cases because the children are typically their dependents; however, identifying the parent responsible for the child's health-care coverage becomes less clear when there is joint physical custody or where the noncustodial parent claims the children as dependents for tax purposes. Since the health reform law does not define "dependent," it is currently unclear which parent will be liable for penalties. Obviously, there are many factors that must be considered before new federal medical support policies are drafted, and any discussion about their details is speculative at this point.

Consideration of Insurance Premiums in Guidelines

Most state guidelines consider the costs of the child's premium in the calculation of the support award, and the adjustment is similar regardless of whether the obligee or obligor carries the child's premium. The California guideline and nine states subtract the premium from the income of the parent providing insurance. California goes a step further and subtracts any premium paid by a parent from income, regardless of whether it is for the children for whom support is being determined, other children, a new spouse, or him- or herself.

The more common approach in state guidelines is to prorate the child's share of the premium costs between the parents. Thirty-five states use this approach. Iowa and Nebraska recently switched from subtracting the premium from the parent's income to the prorated approach. Iowa's rationale was twofold.¹⁸² Iowa believed that subtracting the premium from the parent's income did not provide a "sufficient adjustment for skyrocketing health insurance premiums."¹⁸³ Further, Iowa did not believe that the subtraction method provides an easy or fair method of allocating the cost of the insurance premium regardless of which parent carries insurance for the child. Nebraska similarly abandoned the subtraction approach, reasoning that it did not allocate the premium costs equitably between the parents; it placed most of the additional costs of increased premiums on the parent carrying the insurance; and it provided an economic disincentive for a parent to carry the child's insurance.¹⁸⁴

The prorated approach essentially gives an obligor a credit if he or she is carrying the child's insurance, and it assesses an additional amount of support if the obligee is carrying the child's insurance. If the parent providing the child's insurance is the obligor, the obligee's share of the premium is subtracted from the preinsurance award to determine the final award amount. If the parent providing the child's insurance is the obligee, the obligor's share of the premium is added to the preinsurance award to determine the final award amount.

Exhibits 5-1 and 5-2 illustrate and compare monthly child support orders using:

- The existing approach, which is to subtract the premium from the income of the parent carrying the insurance before calculating support; and
- The alternative approach, which prorates the premium between the parents and either adds or subtracts this amount to the preinsurance award depending on which parent is carrying the health insurance.

Both exhibits assume a case where the parents have equal incomes (i.e., \$3,000 gross per month), there is one child, there is no cost of insurance for either parent, neither parent has another dependent, and the child spends 20 percent of his or her time with the obligor. Both exhibits

¹⁸³ *Id.* at p. 11.

¹⁸⁴ Nebraska Child Support Advisory Com., *Report of the 2006 Nebraska Child Support Advisory Commission: Recommendations* (Nebraska Supreme Ct. & Exec. Bd., Jan. 2007), p. 8.

depict two scenarios: one where the child's insurance premium is \$100 per month, and the other where the child's insurance premium is \$200 per month.¹⁸⁵

Exhibit 5-1 shows that when the obligor carries the child's insurance, California's current approach (i.e., subtraction method) produces a higher obligation than the alternative approach of prorating the health insurance. For example, when the obligor pays \$100 per month for the child's insurance, the order amount is \$379 per month under the subtraction method and \$353 per month under the prorated method.

Exhibit 5-1 also shows that when the insurance premium increases, the reduction of the support award (that considers the premium costs) is more under the prorated approach than the subtraction approach. Under the subtraction method, when the insurance premium increases from \$100 to \$200 per month, the support award decreases by \$24 per month (from \$379 to \$355). In effect, under the subtraction method, the obligor incurs \$76 per month more in additional expenses for the child (i.e., \$100 increase in premium minus \$24 reduction in the support award). The obligee effectively bears \$24 of the \$100 increase in the premium costs even though the obligee's and obligor's income is equal. The prorated approach produces a \$50 decrease in the order amount (from \$353 per month to \$303 per month). The reduction represents the obligee's pro rata share of the \$100 premium amount.

In Exhibit 5-2, the obligee carries the child's health insurance premium. When the premium is \$100 per month, under the subtraction approach, the support award is \$409 per month; under the prorated approach, the support award is \$453 per month. When the insurance premium increases by \$100, the support award increases by \$6 (\$409 to \$415) under the subtraction approach, and by \$50 (\$452 to \$503) under the prorated approach.

¹⁸⁵ All state guidelines that use the prorated approach consider only the child's share of the insurance premium. Further, federal regulation requires that reasonable cost of insurance calculations consider the child's share of the insurance premium only. In practice, however, the child's share is not always obvious because family premiums typically cover the parent as well as the parent's other dependents. Some of the dependents (e.g., a new spouse and children with the new spouse) may not be the same dependents for whom support is being determined. Most state guidelines provide for a determination of the child's share of the premium by defining it as the difference between the premium amounts for family and individual coverage or by prorating the premium by the number of individuals covered by the policy.

Reasonable Cost of Insurance

Prior to the new federal rules, the cost of providing health insurance was considered reasonable if insurance was employer provided. The federal regulation suggests that medical support is

reasonable in cost if it does not exceed 5 percent of gross income but also provides that states can adopt another reasonable alternative in their guidelines.

Cash medical support or the cost of private health insurance is considered reasonable in cost if the cost to the parent responsible for providing medical support does not exceed five percent of his or her gross income or, at State option, a reasonable alternative income-based numeric standard defined in State law, regulations or court rule having the force of law or State child support guidelines.... In applying the five percent or alternative State standard for the cost of private health insurance, the cost is the cost of adding the child(ren) to the existing coverage or the difference between self-only and family coverage.

(45 C.F.R. § 303.31(a)(3).)

A reasonable-cost threshold was first conceived by the National Medical Child Support Working Group, an independent body established under the Child Support Performance and Incentive Act of 1998 to develop recommendations for effective enforcement of medical support orders.¹⁸⁶ The working group recommended that the child's premium be considered reasonable in cost if it did not exceed 5 percent of the gross income of the parent ordered to provide medical support. The working group had reservations about setting the threshold too high because that could reduce the amount of cash child support and the combination of medical support and cash child support could exceed income withholding limits. The source of the 5 percent threshold is a federal SCHIP limitation. States cannot require more than 5 percent of a family's gross income to meet the SCHIP premium. The working group believed that it was appropriate to subject the custodial parent's household and the noncustodial parent to the same standard. Aware of the need for state flexibility owing to state variations in health-care costs and coverage options for children, however, the new rule allows states to set an alternative threshold.

Researchers preparing this study reviewed medical support provisions in all 50 states and the District of Columbia and found that, as of March 2010, 25 states has adopted a reasonable-cost threshold. Most of these states (19 states) use a 5 percent threshold. The review also found two states that have a less than 5 percent threshold (New Hampshire and Oregon use 4 percent) and several states whose thresholds are higher than 5 percent: South Dakota (8 percent of net income); Texas (9 percent of gross income); Alabama (10 percent of gross income); and Colorado (less than 20 percent of gross income). Oregon recently reduced its threshold from 7 to 5 percent because the lower percentage simplified the calculation and was consistent with Oregon's cash medical support policy.¹⁸⁷

A few state guidelines (e.g., Ohio and Wisconsin) do not consider that any insurance available to a parent whose income is near poverty is reasonable in cost. For example, Wisconsin will not

¹⁸⁶ U.S. Dept. of Health & Human Services and U. S. Dept. of Labor, *21 Million Children's Health: Our Shared Responsibility, the Medical Child Support Working Group's Report* (June 2000).

¹⁸⁷ Oregon Dept. of J., *Oregon Child Support Guidelines Changes: Detailed Summary* (Aug. 2009).

consider any health insurance available to a parent whose income is below 150 percent of the federal poverty guidelines. Rhode Island varies its reasonable-cost threshold for obligors with multiple orders.

Many of the states that rely on a higher threshold recognize that a lower threshold increases the likelihood that private coverage will not be ordered even when available from a parent's employer. This can be to the detriment of the child, particularly if the child is not eligible for Medicaid or SCHIP. The unintended consequence is that the child has no health-care coverage. Research from state-specific studies corroborates the problem with lower thresholds. Colorado found that a 5 percent threshold would make private insurance reasonable in cost in 12 percent of examined cases.¹⁸⁸ Georgia found that a 5 percent threshold would make private insurance reasonable in cost in 30 percent of examined cases.¹⁸⁹ Georgia also found that private insurance is reasonable in cost in more cases when a higher threshold is used. For example, Georgia found that a 15 percent threshold would make private insurance reasonable in cost in 70 percent of examined cases.

A handful of states place their reasonable-cost threshold in a non-guideline section of their statutes. These states also place the jurisdiction to seek medical support in the same non-guideline section of their statutes.

Health-Care Insurance and Costs in California

The trend in California, like most of the nation, is fewer employers providing health insurance and higher premium costs. Since the economic recession began, an additional 28 percent of Californians (a population of nearly 2 million) lost their health insurance.¹⁹⁰ Much of this decline is due to job loss or because employers stopped offering coverage. The trend was evident even before the economic recession began. For example, one study notes that the percentage of California children covered by employer-provided insurance dropped from 55 percent in 2001 to 50 percent in 2005.¹⁹¹ About half of all California children, not just those in the California IV-D caseload or those eligible for child support, had health-care coverage through employer-based health insurance in 2008.¹⁹²

Increases in health insurance premiums—both for employer-sponsored health care plans¹⁹³ and individually purchased private insurance¹⁹⁴—have led to declines in individual and family

¹⁹³ Driscoll, *supra* note 190.

coverage. Employers are transferring increased costs to employees by switching to plans with higher deductibles and out-of-pocket costs.¹⁹⁵ The increasing premiums for individual policyholders in California (often as high as 39 percent) was enough for the U.S. Congress to call for an investigation of the insurance companies in 2010.¹⁹⁶

The proportion of income that California families and single parents typically pay to provide insurance coverage for their children is not a readily available statistic. Instead, it is calculated in this report from two data sources. One source is average California premium costs.¹⁹⁷ The other data source is U.S. Census data on income.¹⁹⁸ In 2008, the employee's share of the premium averaged \$62 per month for individual coverage and \$283 per month for family coverage. From this it can be deduced that the children's share of the premium was \$221 per month (\$2,657 per year), which is the difference between the average cost of family and single coverage. This represents 4 percent of 2008 California median family income, 7 percent of California median male earnings, and 10 percent of median female earnings. These percentages approximate what families and single parents typically pay to provide health insurance for their children.

The health reform of 2010 will radically change the costs of health-care coverage for children and eventually render these current statistics obsolete. "Premium credits" under health reform will limit the maximum percentage of income a family will have to spend on its insurance premium. Based on a sliding scale, the percentages range from 2 percent for families with incomes below 133 percent of the federal poverty level to 9.5 percent for families with incomes above 300 percent of the federal poverty level but below 400 percent of the poverty level.¹⁹⁹ One issue relating to this medical support requirement is that the sliding scale considers the premium for the family, not the premium amount attributable to the children for whom support is being determined. The new federal rules limit the amount of premium when conducting a reasonable-cost test to the child's share. Another caveat is that the implementation of premium subsidies is scheduled for 2014. How premium amounts will change in the interim is unknown.

Accessible Insurance

The new federal rules require the IV-D agency to petition to "include private health insurance that is accessible to the child(ren), as defined by the State."²⁰⁰ Some states (23 states) define

¹⁹⁴ Victoria Colliver, "Health insurance hikes stun small businesses: California: Some face premium increases exceeding 75 percent," *San Francisco Chronicle* (Feb. 26, 2010), http://articles.sfgate.com/2010-02-26/news/17957301_1_rate-hikes-health-rates-rate-increases.

¹⁹⁸ In 2008, California median family income was \$70,029, median earnings of a California male worker were \$35,931, and median earnings of a California female worker were \$25,898. U.S. Census Bur. American Factfinder, "B19113 Median Family Income in the Past 12 Months (in 2008 Inflation-Adjusted Dollars)," 2008 American Community Survey (as of Apr. 4, 2010), <http://factfinder.census.gov>.

¹⁹⁹ Henry J. Kaiser Family Foundation, *supra* note 181.

²⁰⁰ 45 C.F.R. § 303.31(b)(1).

accessible insurance in their guidelines; however, the states are not required to include a definition their guidelines.

The requirement's purpose is to ensure that whatever the insurance ordered it can be used by the child. Health plans may not be accessible because they serve a limited geographical region or because new employees must go through a waiting period before they are eligible to receive the employer's health benefits. Federal rules provide that the state define "accessible" as appropriate for that particular state. The National Medical Child Support Working Group recommends that the consideration of accessibility determine whether the child lives within the health plan's service area and whether primary care is available within the lesser of 30 minutes or 30 miles of the child's residence. In addition, the working group recommends assessing whether coverage can reasonably be expected to remain effective for at least one year, based on the parent's employment history.

California's definition of "accessible" insurance is included in the guideline:

When ruling on a motion made pursuant to this section, in order to ensure that the health care needs of the child under this section are met, the court shall consider all relevant facts, including, but not limited to, the following:

- (1) The geographic access and reasonable availability of necessary health care for the child which complies with the terms of the health care insurance coverage paid for by either parent pursuant to a court order.
- (2) The necessity of emergency medical treatment that may have precluded the use of the health care insurance, or the preferred health care provider required under the insurance, provided by either parent pursuant to a court order.
- (3) The special medical needs of the child.
- (4) The reasonable inability of a parent to pay the full amount of reimbursement within a 30-day period and the resulting necessity for a court-ordered payment schedule.

(Fam. Code, § 4063(g).)

States vary in how they define "accessible." Eleven states define "accessible" by the number of miles or minutes from the child's primary residence; nine states consider "accessible" to include the geographic scope or county of the child's primary residence; and four states provide that health-care coverage is accessible if the covered children can obtain services with reasonable effort by the parents or within a reasonable traveling distance and time from the child's primary residence. The latter is particularly salient to states like California, where there is considerable geographical diversity, including both urban and rural areas, as well as variation in access to health-care facilities and health-care providers by geographical region.

Cash Medical Support

State IV-D agencies are federally mandated to petition for cash medical support when accessible private health insurance is not available to parents at a reasonable cost. This mandate necessitates a clear definition of “cash medical” support. Federal regulations broadly define cash medical support as:

[A]n amount ordered to be paid toward the cost of health insurance provided by a public entity or by another parent through employment or otherwise, or for other medical costs not covered by insurance.

(45 C.F.R. § 303.31(a)(1).)

OCSE intentionally set a broad federal definition of cash medical support to allow states flexibility and discretion in defining cash medical support in alignment with their individual state initiatives or policies.²⁰¹ States can provide for cash medical support in three ways: (1) an amount to be paid toward the cost of health insurance provided by a government or public entity such as Medicaid or SCHIP; (2) an amount to be paid toward the cost of health insurance provided by another parent; or (3) an amount to be paid for other medical costs not covered by insurance.

As will be discussed in more detail later, the California guideline provides for two of the three definitions of cash medical support. The first definition (e.g., an amount to be paid to the Medicaid agency or a similar program) is not feasible when health-care services are delivered through fee-for-service. As discussed earlier, a Medicaid agency cannot receive more than what it expends on a child. When Medicaid is provided through managed care, a state Medicaid agency typically pays a monthly premium rate for each Medicaid enrollee to the managed-care provider. As a consequence, the Medicaid agency can accept cash medical support receipts up to that premium amount. However, when child Medicaid services are reimbursed through fee-for-service, the costs of health care for the child are not consistent from month to month. This does not lend itself well to reimbursements through cash medical support.

California, like many states, relies on a mixture of managed care and fee-for-service to deliver its child Medicaid services (called Medi-Cal in California). This is common in many states. In California, almost all Medi-Cal services in rural areas are delivered through fee-for-service.²⁰² Taken together, these factors make the development of a consistent statewide policy for using cash medical support to offset Medi-Cal coverage impossible. Numerous other states face a similar limitation. In fact, although at least 16 states provide for this type of cash medical support, a minority of states actually collect cash medical support and distribute it to the

²⁰¹ 73 Fed.Reg. 42416–42442.

²⁰² Miles Hochstein et al., *Medi-Cal Reimbursement: Its Significance for California Children* (Univ. of Cal., Los Angeles, Cal. Policy Research Center, May 2000), www.healthchild.ucla.edu/.../MediCal%20reimbursementbrief0500.pdf.

Medicaid agency (e.g., Ohio, Oregon, Rhode Island, and Texas). Besides the fee-for-service issue, other barriers are the practicality of collecting this type of cash medical support when many low-income obligors are stretched just to comply with the base child support order, the automated system enhancements needed to track this type of cash medical support, and the need to develop interagency rules and procedures between Medicaid and the IV-D agency.²⁰³

In addition to Medi-Cal, California offers many other low-income insurance options for children. These include Healthy Families (California's SCHIP program) and Healthy Kids (which operates in some counties).²⁰⁴ Because these programs are public entities, cash medical support can be ordered to offset the coverage costs from any of them. Most of these programs assess a nominal premium to the custodial parent, so the cost of that premium to the custodial parent would be considered in the guideline calculation. (As discussed earlier, California subtracts the premium cost from the income of the parent providing coverage.) The policy dilemma is whether additional cash medical support should be assessed to cover the public entity's share of the premium. For example, additional medical support could be ordered and paid to Healthy Families. No state, however, collects and distributes cash medical support directly to its SCHIP program for many of the same reasons that states do not routinely collect and distribute cash medical support to their state Medicaid programs.

The other two definitions of cash medical support (i.e., amount to be paid toward the cost of health insurance provided by another parent and the amount to be paid for uninsured medical costs) are already provided for in the California guideline. Specifically, if the obligee provides the child's insurance, the final child support order is adjusted through the subtraction of the premium amount. This meets the option for cash medical support to offset the other parent's cost of coverage.

Uninsured Health-Care Expenses

In addition, the California guideline addresses reasonable uninsured health-care expenses (Fam. Code, §§ 4062(2), 4063). Most state guidelines also provide for uninsured health-care expenses. A key difference between California and other states is that these expenses are divided in half between the parents in California, while most states prorate the expenses between the parents. The California guideline, however, does allow either parent to request an alternative apportionment similar to a pro rata share (Fam. Code, § 4060(b)). The prorated approach is more consistent with a conventional income shares guideline and state guidelines that prorate the child's insurance premium between the parents. As discussed in Chapter 2, California does not rely on the conventional income shares approach. The conventional income shares approach determines the noncustodial parent's base level of support by taking the noncustodial parent's pro rata share of average expenditures in an intact family with a similar family size and combined parental income.

²⁰³ Center for Policy Research, *supra*. note 164.

²⁰⁴ Cal. Healthcare Foundation, *California Health Care Almanac, Children's Health Coverage Facts and Figures* (Nov. 2009).

Another key difference between the California guideline and state guidelines that rely on the conventional income shares guideline is that an income shares schedule typically includes a nominal amount of base support to cover routine and ordinary uninsured medical expenses such as copays, over-the-counter medicines, and bandages. This counts as the federal definition of “cash medical support.”²⁰⁵ Most income shares include \$250 per child per year for routine medical expenses. This approximates average out-of-pocket medical expenses for children.²⁰⁶ It is unclear whether the *K*-factor under the California guideline includes any routine and ordinary uninsured medical expenses, but it is fairly certain that the California guideline does not include the \$250 average because this amount was calculated for a time period several years after the existing California guideline formula was developed. Nonetheless, because of cost-sharing subsidies under 2010 health reform, this will no longer be the average in the future.

Chapter Summary

The 2008 federal rules necessitate changes to state provisions for medical support, but the more recent 2010 health reform regulations make the future of medical support uncertain. OCSE has just begun to assess whether its current federal mandates on medical support are congruent with health reform. Depending on the outcomes of this assessment, federal medical support requirements imposed on states may change. For now, the current federal medical support rules apply. These require that state guidelines address how children’s health-care needs will be addressed, that states provide that either or both parents can be ordered to pay medical support, that states specify a quantitative threshold for determining whether medical support is reasonable in cost, that states define “accessible” insurance, and that states provide for “cash medical support.” With the exception of the quantitative threshold for determining reasonable cost, California complies with these current federal medical support rules.²⁰⁷

California’s approach to provisions that affect what is ordered as medical support differs from those of most states. Most states provide most of their medical support provisions within their state guidelines, while California provides some of its key medical support provisions in another part of statute. Like most states, however, California provides that either or both parents can be ordered to carry health insurance for the children.

California also differs from other states in its treatment of the child’s insurance premium in the guideline calculation. California subtracts the premium from the income of the parent carrying insurance. Most state guidelines prorate the child’s insurance premium between the parents and add the obligor’s share to the base support award if the obligee carries the insurance, or they subtract the obligee’s share from the base support award if the obligor carries the insurance. Iowa and Nebraska have recently switched from the subtraction approach to the prorated approach

²⁰⁵ 73 Fed.Reg. 42,419.

²⁰⁶ Center for Policy Research, *supra* note 164.

²⁰⁷ Proposed Senate Bill 580 would correct that. See *supra* note 153.

because they believed the subtraction approach was an insufficient adjustment, particularly when premium amounts are rising.

California currently does not provide a quantitative threshold for determining “reasonable cost” of insurance. The new federal regulation requires the use of a threshold based on a percentage of income. Most of the 19 states that have adopted a threshold rely on the 5 percent threshold suggested in federal regulation (e.g., the child’s share of the health insurance premium is reasonable in cost if it does not exceed 5 percent of the gross income of the parent carrying the insurance).²⁰⁸ However, the federal regulation is clear that the precise amount of the threshold is at state discretion because the federal government recognizes state variations in health-care delivery systems and health-care costs. The rationale for the 5 percent threshold is that it is consistent with the federal maximum out-of-pocket costs that can be charged to custodial parents whose children are enrolled in SCHIP. The rationale for a lower threshold is affordability, particularly among parents with poverty or near-poverty incomes. The rationale for a higher threshold is that premiums can absorb more than 5 percent of a parent’s income; with a higher threshold, the parent is more likely to be ordered to carry private insurance, which is better than no coverage for the children at all.

States must also define “accessible insurance” because, under the 2008 federal medical requirements, state IV-D agencies must also petition for insurance coverage that is accessible to the child. (The federal regulation leaves the definition of “accessible” to state discretion.) California and 22 other states provide a definition. Most of the definitions, including California’s, consider geographic access; however, some of these geographic-based definitions specify that health services must be 30 miles, 30 minutes, or another quantitative threshold from the child’s residence. The California definition is not this specific.

Finally, new federal regulations require state IV-D agencies to petition for cash medical support when private insurance (that is accessible to the children and reasonable in cost) is not available at the time the order is entered. The federal regulation defines three types of cash medical support. One type concerns cases where the obligee carries the child’s insurance and essentially requires some sort of dollar adjustment to the final support award for the premium costs, such as subtracting the premium from the income of the parent or prorating the premium between the parents in the guideline calculation. The second type concerns the provision of the child’s uninsured health-care expenses. The California guideline provides that these are to be divided equally between the parents but can be prorated between the parents if requested. Most state guidelines prorate uninsured health-care expenses and include a nominal amount for uninsured medical expenses (i.e., typically \$250 per child per year) in the base support amount to capture typical and routine uninsured medical expenses (e.g., over-the-counter medicines and copays). It is not clear whether the *K*-factor in the California guideline includes anything for typical and routine uninsured medical expenses. The third type of cash medical support refers to a dollar amount ordered and distributed to the Medicaid agency (or similar public entity) to offset

²⁰⁸ Some states that rely on the 5 percent threshold relate it to the parent’s net income rather than to the parent’s gross income.

coverage costs for Medicaid children (or children whose health-care coverage is provided by a similar public entity). California and most states do not order this type of cash medical support because Medicaid rules effectively preclude it when Medicaid is delivered through fee-for-service and for other reasons. Medicaid for about half of California's children's is delivered through fee-for-service.

CHAPTER 6

Input From Stakeholders

California law requires that its child support guideline review process include a consultation with a broad cross-section of groups involved in child support issues. This consultation is important to solicit input on what problems people who are using the guideline have, what issues they see in its application, and what recommendations they have for changing the guideline that would make it easier to use, more equitable in its outcomes, and yield support orders that are in the best interest of children.

To conduct this consultation, researchers from the Center for Policy Research (CPR) conducted focus groups in both Northern and Southern California. This chapter describes how CPR identified and recruited stakeholders for these focus groups, how CPR conducted the focus groups, and the findings from the focus groups. Chapter 4 of this report presents information about other focus groups that reviewed the case file data and helped to interpret it.

Identifying and Recruiting Stakeholders

Identifying Stakeholders

In its first step to recruit advocates for the focus groups, CPR conducted Internet research using search terms to locate California advocacy groups. Search inquiries included combinations of the following terms: “California,” “advocates,” “noncustodial,” “custodial,” “children,” “families,” “rights,” “child support,” “mothers,” “fathers,” “parents,” “low-income,” and “divorced.” CPR selected from the list generated by these search terms the advocates whose missions aligned with the objectives of the guideline review. For example, CPR selected the advocate groups whose missions were to assist custodial or noncustodial parents; represent women’s, mothers’, men’s, or fathers’ rights in child support issues; and/or represent the economic interests of low-income children or families.

The Department of Child Support Services (DCSS) also provided CPR with a list of its advocate contacts. The list generated from the search inquiries, together with the DCSS contact list, met the requirement under Family Code section 4054(d) that the guideline review include consultation with a “broad cross-section of groups involved in child support issues,” including, but not limited to, the following:

- (1) Custodial and noncustodial parents;
- (2) Representatives of established women’s rights and fathers’ rights groups;
- (3) Representatives of established organizations that advocate for the economic well-being of children;
- (4) Members of the judiciary, district attorney’s offices, the Attorney General’s office, and the Department of Child Support Services;
- (5) Certified family law specialists;

- (6) Academicians specializing in family law;
- (7) Persons representing low-income parents; and
- (8) Persons representing recipient of assistance under the CalWORKs program seeking child support services.

(Fam. Code, § 4054(d).)

A few individuals also contacted CPR directly because they knew CPR was awarded the contract to review the California child support guideline. CPR added these contacts to the advocates list as well.

The final list, which included individuals representing advocacy groups generated from CPR's online search, contacts provided to CPR by DCSS, and individuals who contacted CPR directly, totaled 48 individuals. Few advocates were identified only as advocates for custodial parents or noncustodial parents. Rather, most claimed in their mission statements to represent children or families.

CPR conducted focus groups in Northern California (San Francisco) and Southern California (Burbank) to make attendance more convenient for the advocates. CPR therefore divided the advocate list by characterizing the advocate groups as operating in Northern or Southern California. The divided lists included individuals from the following advocate groups:

From Northern California:

- Association for Children for Enforcement of Support (ACES) (*DCSS referral*)
- Bay Area Fathers and Affiliates
- California Alliance for Families and Children
- Capitol Resource Institute
- The Center for Families and Fathers
- Children Now
- Coalition of Welfare Rights Organization, Inc. (*DCSS referral*)
- Divorced Father's Network
- Fatherhood Collaborative of San Mateo County
- Legal Services of Northern California (*DCSS referral*)
- Mothers & More, Silicon Valley Chapter
- The Novato Mothers Club
- Options for Fathers (*DCSS referral*)
- Partnership for Responsible Parenting (*DCSS referral*)
- Rubicon Programs, Inc. (*DCSS referral*)
- Western Center on Law & Poverty, Bay Area
- Western Center on Law & Poverty, Sacramento

From Southern California:

Alliance for Children Concerned About Move-Aways
Association for Children for Enforcement of Support (ACES) (*DCSS referral*)
California Men's Center
California Women's Law Center
CaliforniaKids Healthcare Foundation
Children's Advocacy Institute
Children's Bureau
Children's Rights Council (CRC of Orange County/Long Beach)
Children's Rights Council (CRC of San Diego)
Children's Rights Initiative for Sharing Parents Equally
Children's Partnership
Coalition of Parent Support (chapter of American Coalition for Fathers and Children) (*DCSS referral*)
Coalition of Parent Support (*DCSS referral*)
Fathers and Families
Harriett Buhai Center for Family Law (*DCSS referral*)
The Mommies Network
Mothers & More, Pasadena Chapter
Mothers & More, West Valley Chapter
Mothers & More, Conejo Valley Chapter
My Child Says Daddy (*DCSS referral*)
National Coalition for Men
National Coalition for Men, Los Angeles Chapter
Single Parents United 'N' Kids (*DCSS referral*)
United Fathers of America
Western Center on Law & Poverty, Los Angeles

Recruiting Stakeholders

CPR used similar techniques to recruit advocates from the northern and southern regions of California for the first round of focus groups. Specifically, CPR sent all 48 individuals an e-mail invitation as well as a fax invitation to those advocates with an available fax number. Advocates from Southern California responded quickly, so no follow-up contact was necessary. The Northern California advocates, however, did not respond as quickly, so CPR made two follow-up telephone calls to these advocates to encourage their participation. If the individuals did not answer the follow-up telephone calls, the CPR representative left them a detailed voicemail about the focus group. Finally, CPR sent an e-mail to the advocates closer to the date of the focus group.

The individuals who declined attendance did so either because they were unable to attend or because their groups did not work in areas of child support relevant to the guideline review. Although more individuals confirmed their attendance, individuals from the following advocate groups actually attended the first focus groups:

Northern: San Francisco Focus Group

- Bay Area Father and Affiliates
- Fathers and Families
- California Alliance for Families and Children (two individuals)
- Divorced Father's Network
- Legal Services of Northern California
- Partnership for Responsible Parenting (two individuals)

Southern: Burbank Focus Group

- Alliance for Children Concerned About Move-Aways
- California Men's Center
- Coalition of Parent Support
- National Coalition for Men
- My Child Says Daddy (three individuals)
- Fathers and Families
- Harriet Buhai Center for Family Law

Three independent advocates also attended the Burbank Focus Group.

For the second round of focus groups, CPR used the same list of 48 individuals. CPR e-mailed all 48 individuals to invite them to the case file review focus group in San Francisco. CPR then made a follow-up telephone call to these individuals and left voicemails for those who did not answer. CPR sent out a second e-mail, further explaining the purpose of the case file review focus group. Finally, CPR followed up via telephone with those who expressed interest in attending the case file review focus group but who had not yet responded.

Similar to the first focus group, individuals who declined to attend did so because they were unable to attend or because their groups did not work in areas of child support relevant to the guideline review. A few individuals in the second focus group were enthusiastic about participating, but financial constraints kept them from commuting to San Francisco. CPR accommodated these individuals by arranging for their participation via teleconference.

The individuals who attended the San Francisco case file review were some of the same individuals who attended the previous focus groups. There were, however, some new participants. Individuals representing the following advocate groups attended the San Francisco case file review:

California Alliance for Families and Children (attended San Francisco discussion)
California Men's Center (attended Burbank discussion) – *via teleconference*
Coalition of California Welfare Rights Organization, Inc. (new attendee)
Coalition of Parent Support (attended Burbank discussion) – *via teleconference*
Fatherhood Collaborative (new attendee)
Legal Services of Northern California (attended San Francisco discussion)
Partnership for Responsible Parenting (2 individuals, both attended San Francisco discussion)
Novato Mothers Club (new attendee)

One independent advocate also attended the case file review.

Conducting the Focus Groups

CPR used a semi-structured format to conduct the focus groups. For the first two focus groups in San Francisco (March 16, 2010) and Burbank (March 29, 2010) CPR used the following format:

- CPR welcomed participants and participants made introductions.
- CPR asked participants to identify the factors that the current California child support guideline takes into consideration when it calculates the child support order. The intent of this task was to focus the participants on guideline issues that would be discussed in more detail later.
- CPR asked participants to comment on how well parents and potential guideline users understand how child support is calculated.
- CPR solicited advice on whether the factors currently considered in the guideline are appropriate, whether some should not be considered, and whether other factors should be considered.
- CPR asked participants for their advice on whether the current factors produce a fair amount for the parent obligated to pay support and for the parent receiving support.
- CPR asked participants if the California guideline as a whole is appropriate and fair.

CPR allowed time for participants to provide comments on any other issues they had with the guideline and to close with any final thoughts. CPR focus group facilitators attempted to ensure that all participants were provided an opportunity to comment.

A court reporter was present at the first two focus groups in San Francisco and Burbank to record the proceedings. Participants were advised that specific comments would not be attributed to named individuals or organizations in the written report.

Participant Survey

Participants in the focus groups were asked to complete a short survey when they arrived at the focus group site. The first question was a series of statements that asked respondents to rank their level of agreement or disagreement with how well the guideline was meeting the principles of

the uniform guideline set forth by statute (Fam. Code, § 4053). Eleven participants provided responses. The survey is reproduced below. The number of actual responses for each question has been added in the shaded area. The responses to question 2, which requests suggestions for improving the appropriateness, fairness, and comprehensiveness of the guideline, were minimal but are incorporated in the discussion of major themes that follows.

Focus Group Participant Survey (All responses are confidential)

1. Below are several statements about the California Statewide Uniform Guideline. Please tell us how much you agree or disagree with each statement.					
	Strongly Agree	Agree	Un- decided	Disagree	Strongly Disagree
a. The guideline assumes parent's first and principal obligation is to support his or her minor children according to the parent's circumstances and station in life.	5(2)	4(3)		2(5)	1(1)
b. The guideline assumes both parents are mutually responsible for the support of their children.	5(3)	4(4)		2(3)	1(1)
c. The guideline takes into account each parent's actual income and level of responsibility for the children.	5(2)	4(3)		2(1)	1(5)
d. The guideline reflects that each parent should pay for the support of the children according to his or her ability.	5(1)	4(5)	3(2)	2(1)	1(2)
e. The guideline seeks to place the interests of children as the state's top priority.	5(2)	4(4)		2(1)	1(4)
f. The guideline reflects that children should share in the standard of living of both parents.	5(1)	4(3)	3(1)	2(2)	1(4)
g. When both parents have high levels of responsibility for the children, the guideline minimizes significant disparities in the children's living standard in the two homes.	5(1)	4(2)	3(3)	2(3)	1(2)
h. The guideline considers that the financial needs of the children should be met through private financial resources as much as possible.	5(3)	4(1)	3(4)	2(1)	1(2)
i. The guideline presumes that a parent having primary physical responsibility for the children contributes a significant portion of available resources for support of the children.	5(2)	4(6)	3(2)	2(1)	
j. The guideline seeks to encourage fair and efficient settlements of conflicts between parents and seeks to minimize the need for litigation.	5(1)		3(3)	2(2)	1(5)
k. The guideline identifies the special circumstances in which child support orders should fall below the child support amount mandated by the guideline formula.	5(1)	4(1)	3(3)	2(5)	1(1)
l. The guideline limits the number of special circumstances in which support orders differ from the child support amount mandated by the guideline formula.	5	4(4)	3(4)	2(2)	1(1)
m. The guideline provides sufficient support reflecting the state's high standard of living and high costs of raising children compared to other states.	5(2)	4(1)	3(3)	2(3)	1(2)

2. Please provide suggestions for improving the appropriateness, fairness and comprehensiveness of the Guideline. _____

Major Themes

Given the backgrounds of the participants, it is not surprising that they were well informed about child support issues in general and the guideline in particular. It is also not surprising that many participants had very strong feelings about the guideline, often informed by years of experience in working with clients involved in the child support system or their own personal cases. They were able to offer constructive advice and important anecdotal evidence for this guideline review.

Four major themes emerged from the focus groups in San Francisco and Burbank:

- **Comprehension.** Participants believe that parents do not understand the child support calculation because they are unfamiliar with the multiple factors used to calculate support in the California guidelines.
- **Interrelationship.** Participants contend that child support guideline issues are interrelated with other family law issues, such as custody and parenting time, and those issues must be addressed as well.
- **Fairness.** Participants generally do not believe that the current child support guideline produces a fair result for a variety of reasons.
- **Application.** Participants believe that the child support guideline is applied incorrectly in too many cases.

Similar issues were identified in both focus groups, and the opinions and advice given on these issues were generally, but not always, consistent between the groups. Below is a detailed discussion of each of these major themes.

Comprehension

Participants generally believed that parents do not understand the child support calculation because they are unfamiliar with the multiple factors used to calculate support in the California guidelines. They believed that when parents fail to understand what has gone into the guideline calculation, it sometimes creates distrust of and resentment against the system. Multiple participants identified the need for parents to receive education regarding the factors taken into account in calculating child support and the factors that are excluded and that parents might commonly think would be relevant.

General Comprehension

With some exceptions, participants believed that parents lack knowledge about what goes into the guideline calculation. Some of the comments included:

They see a judge typing numbers into it. They have no idea how it's played out.

I think people get confused when they go into child support offices, local CSAs, and one worker will give them one estimated figure; three weeks later, they go in and give a court date and they have another estimated figure.

Nobody seems to know the full scope of what's taken into consideration.

Usually low-income people that I talk with have a very almost nonexistent understanding of not just the formula but the entire system. They're scared to death.

Complexity

Many participants believed that the calculations were too complex and should be made more transparent. Participants' views on this particular issue did vary, however. Participants in San Francisco unanimously believed the calculations were too complex, but some Burbank participants contended otherwise. One participant in San Francisco stated:

{It} is far too complicated, far, far too complicated.

Some participants noted that the lack of understanding means that parents believe the other parent may be duping them:

[People] don't have buy-in to those numbers.

If you could get some transparency, then families can begin to heal.

The participants in Burbank who disagreed believed that the calculations were understandable. They found that the automated calculator helped. One participant stated:

I hear everybody say it's complicated, but I think it's very simple.

Even though the majority of participants believed the guidelines were too complex, when pressed to specify factors that should be eliminated, there was little agreement.

Need for Education

Participants suggested that more efforts should be made to educate parents about what goes into the guideline calculation. Some participants suggested having a brochure at the court for parents to review that outlines the formula and/or education available at the court (the PACT class in Los Angeles County was suggested as a model). Other suggestions were to "put something on the Web that would be straightforward" or post the formula outside child support courtrooms.

They need to be educated They feel they are getting ripped off, but when we educate them and teach them on the child support, how it's calculated, then they have a better feeling.

I think how you make them take a parenting class, they should take a child support class too.

Some participants also commented that parents sometimes do not know that in-kind support, such as buying shoes for a child, does not count as child support. That causes conflict between the parents.

Interrelationship

Participants viewed child support guideline issues as interrelated with other family law issues, such as custody and parenting time. Many participants believed these issues create parental conflict, which affects child well-being. Therefore, many contended that these issues must be addressed before or simultaneously with consideration of guideline issues. When participants discussed these types of issues, they generally believed that not all of the underlying principles of the guideline were being achieved or should be pursued. For example, they did not believe that current child support policies are always in the best interest of the child, which is one principle underlying the guideline.

Custody

Many participants discussed the need to address custody issues as a paramount concern. Some participants stressed changing the terms used by child support to make the process friendlier (i.e., don't use "custodial" and "noncustodial parent," "visitation," or "absent parent"; instead use "shared parenting" and "coparenting"). Others wanted to start with a presumed 50/50 share of custody. Several participants commented that by moving closer to 50/50 percent shared parenting, the guideline would encourage participation of both parents in the lives of the children and also increase payment of child support:

Until custodial ratios are balance[d] out and equal parenting time is address[ed] . . . a lot of this is going to be moot. . . .

[O]nce we move toward more equitable distribution and custody a lot of these issues will just go away and the guideline will work. . . .

[B]ut if the guidelines don't encourage a ruling that allows the child to have the most time with both caring and loving responsible parents, it fails, period.

Custody is number one. The way it impacts these guidelines can make the guidelines moot to a certain degree because . . . [t]hey find that . . . the mom is the primary parent and the dad's the primary breadwinner.

Parenting Time

some participants believed that the current timesharing arrangement in California law leads to conflict and arguments between parents, who sometimes try to maximize or minimize time with the child to get the most advantageous support order. As one participant commented:

Since 'timeshare' is factored directly into the Guideline formula, any parent wishing to modify child support up or down merely litigates timeshare instead of litigating child support. . . . Accordingly, the Guideline's timeshare component, as implemented, shifts child support conflicts into timeshare conflicts, increasing the stakes and conflict between the parents. This shifting of the conflict leads to a longer, more expensive, and less efficient settlement of the underlying issue.

Reducing Conflict

Participants offered some concrete suggestions for reducing conflict between parents. One suggestion was to adjust for timesharing in block times (e.g., 0 to 10 percent timesharing; 11 to 25 percent timesharing; and so forth) to reduce the conflict over parenting time. One participant stated:

[I]f you have two parents with equal timeshare and there is no disparity of income, in other words, their income is exactly the same but they are sharing [] custody, then neither owes each other support.

Another participant suggested early-intervention education during the divorce process about the responsibility of raising a child as a way to reduce conflict between parents. A participant suggested that there would be less conflict if the guideline were less exact and income measurements had a +/-20 percent threshold (i.e., if father and mother make within 20 percent of one another, there would be no order).

Fairness

Overall, participants did not believe the current child support guideline produces a fair result. They expressed concerns about how it treats specific people or groups of people, like noncustodial parents, and what goes into the calculation. As one participant commented:

No, it's not fair because . . . they don't look at parents as equal people. So you're starting off on a bad foot in the first place.

Treatment of Low-Income Parents

Participants consistently believed that the guideline is unfair to low-income parents. In particular, many participants expressed concern about how the guideline treats low-income *noncustodial* parents. One participant commented:

I think there should be an absolute floor. If you're below a certain income you don't pay child support period, poverty level or whatever.

Participants expressed considerable support for increasing the low-income adjustment:

It's a thousand now to get the deduction and I think it should be higher.

The way the guideline is working out for low-income [people] is too high. It is patently hurting low-income [people].

One participant also identified the need to determine a credit for a child when the noncustodial parent is receiving Social Security disability.

Cost of Raising a Child

Some participants preferred that the guideline be based solely on the cost of raising the child, rather than on income. This was particularly true in the San Francisco focus group, where many of the attendees were in agreement on this issue. They believed that this method would be less subjective in determining the child support amount and would be more accurate because it is too easy for people to hide what they really make. In their view, basing the guideline solely on the cost of raising the child would create less conflict between parents. One participant in Burbank agreed with this viewpoint, but most of the other participants in Burbank felt that this method would be unreasonable because the amount that a parent spends on a child naturally varies by income. As one participant said:

The cost of raising children is not independent of family income.

Standard of Living

Some participants questioned the principle that the child should share in the standard of living of both parents, even if it means improving the standard of living of the custodial parent. Participants also commented that assessing high support levels to high earners was unfair because it increases the custodial parent's standard of living while lowering the noncustodial parent's.

Imputing Income

Participants expressed concern about imputing income based on earning capacity, particularly with the economic downturn, because people have lost jobs and have trouble finding new jobs at the same income level. One participant disagreed, however, and pointed out that some parents voluntarily quit their jobs to avoid high child support payments.

Additionally, several participants expressed concerns about imputing (or presuming) income for low-income parents in general.

Other Fairness Concerns

Participants expressed a variety of other miscellaneous concerns relating to the fairness of the guideline:

- One participant expressed the view that reexamining the guideline to neutralize tax benefits would reduce conflict.
- Several participants preferred that the guidelines use gross rather than net income to establish child support awards.

- A number of attendees expressed support for a legislative bill that would define the reasonable cost of health care at 5 percent of income.
- One participant commented that the guideline should clarify that a judge cannot order the custodial parent to conduct a job search as a condition to receiving child support benefits.
- A number of participants expressed general concerns about the economic basis of the guideline. These participants believed that the economic studies should be reexamined.
- Some participants viewed the interest that accrues on child support as problematic, particularly for those in prison.
- Participants expressed some minor support for the idea that in-kind payments should be taken into account in the guideline.
- One participant commented that the guideline percentage at high-income levels is too high:

[Y]ou can wind up in a situation where you do breed . . . laziness in a parent which is receiving support.

Application

Some participants believed the child support guideline is applied incorrectly in too many cases. Many participants raised concerns about the mechanics of the application of the guideline and how it is actually applied in practice and about the resulting integrity of the order.

Inconsistent Application

Participants contended that parents are assessed different child support amounts depending on who performs the calculation.

You talk to one [case] worker and you'll get one answer. Then you talk to somebody else, you will get another answer.

One participant expressed the view that judges make changes and do not state the reason for the deviation. In addition, a number of participants commented that they thought the SDU calculator (DCSS calculator) and the DissoMaster produce different numbers.

Better Training Needed

Some participants suggested that better training should be provided to DCSS and court staff.

There needs to be better training with department workers so that people . . . get the same answer from two or three people . . . and that accurate information is given to people.

Income Information

Participants suggested that taking more time and care to obtain income information from parents would produce more accurate and fair child support order amounts. One participant commented that DCSS staff do not take the time to find accurate information.

Perjury

A few participants suggested that the issue of perjury needs to be addressed in the context of child support hearings. They believed that perjury on the part of parents testifying in court taints the entire process.

Perjury is the number one issue that needs to be dealt with in this whole system.

Perjury must be addressed or this whole guideline is a joke I know the D.A.s in California are very reluctant to prosecute perjury for some reason. I don't understand that because that's the foundation of the whole legal system.

One participant mentioned a related issue:

[G]uys . . . are paying for children that DNA has proven they did not father.

Enforcement and Accountability

The enforcement of child support orders was a concern of several participants. One participant expressed the concern that DCSS will go after those payers who are easy to get money out of and ignore the rest. Another participant suggested that there should be a mechanism to determine whether child support is actually spent on the child.

Chapter Summary

Participants expressed many concerns about the current child support guideline. Most participants offered constructive advice on how they believed the guideline could be improved. Some participants wanted to start fresh with a new guideline. There was no consensus, however, on the framework of a new guideline.

CHAPTER 7

Conclusions and Recommendations

This chapter presents conclusions and recommendations from the 2010 review of the California Uniform Guideline. The guideline has been reviewed in accordance with state and federal requirements (Fam. Code, § 4054(a); 45 C.F.R. § 302.56). The review fulfills the federal requirements to consider economic evidence on the costs of raising children and to analyze case file data to determine how the guideline is being applied and to ensure that deviations are limited. Pursuant to Family Code section 4054(f), representatives from a cross-section of groups were invited to participate in focus groups to share their perspectives and recommendations. In addition, pursuant to Family Code section 4054(d), the review considered two matters in depth: child support guidelines for low-income families and underlying factors affecting statutory provisions for establishing and modifying medical support orders.

The conclusions are organized by chapter. Recommendations follow the conclusions.

Basis of Child Support Guidelines and Studies of Child-Rearing Expenditures

The economic basis of the California guideline was reviewed and compared to those of other state guidelines. The California guideline was also compared to the most current economic evidence of child-rearing expenditures. In addition, other factors that affect state guideline formulas and schedules were explored.

Conclusion 1: The California guideline and 36 other state guidelines are based on a “continuity-of-expenditures model”—that is, the child support award should allow the children to benefit from the same level of expenditures that would have been provided had the children and both parents lived together. State guidelines based on this concept apply it equally to children of divorce and children of unmarried parents, regardless of whether the parents ever lived together, because most states believe that children should not be the economic victims of their parents’ decisions to live apart. Most of these states, including California, base their guideline formulas on measurements of child-rearing expenditures in intact families and periodically assess their formulas against newer measurements to ensure that they produce an adequate amount.

There are other data and premises that could be used to develop state guidelines or determine support for special populations. These include economic data such as child-rearing expenditures in single-parent families, foster care payments, and the self-sufficiency wage. Further, a child support guideline formula or parts of the guideline formula could be based on other factors besides child-rearing expenditures. For example, when both parents are impoverished, neither parent can afford what it actually costs to raise a child, so many states base the guideline amounts at very low income or token amounts or an amount that leaves the obligor with

sufficient income after paying child support for at least a subsistence level of living. Other alternatives could include consideration of the relative standard of living of the obligor's household and the household of the obligee and the children after payment or receipt of child support or recognition that one or both parents have children with multiple partners. With the exception of guidelines amounts for low-income parents, however, there is no to little experience with these alternatives.

Conclusion 2: The California guideline formula is generally within the range of measurements of child-rearing expenditures—but at the high end of the range of measurements of child-rearing expenditures. This assessment is based on comparisons of the California guideline to eight measurements of child-rearing expenditures, including those that underlie other state guidelines and current measurements.

The California guideline is assessed by comparing its parameters to eight estimates of child-rearing expenditures that either underlie other state guidelines or represent the most current estimates available.²⁰⁹ At the core of the California guideline formula is the *K*-fraction, which represents the percentage of net income devoted to child-rearing expenditures for one child. The *K*-fraction for parents whose combined income is between \$801 and \$6,666 net per month is 25 percent. The estimated percentage of total expenditures devoted to child rearing is 24 to 27 percent and could be as low as 18 percent when work-related child-care expenses and out-of-pocket medical expenses, which are additions to base support (i.e., the amount calculated from the *K*-fraction) under the California guideline, are excluded.

The California guideline multipliers for two and three children are 1.6 and 2.0, respectively. The multipliers calculated from the measurements of child-rearing expenditures ranged from 1.4 to 1.7 for two children and from 1.6 to 2.0 for three children. Most of the estimates of child-rearing expenditures do not extend to four or more children. Instead, the California multipliers are assessed by comparing them to those used in other states. We found that the California guideline formula for one, two, and three children is within the credible range of the estimates of child-rearing expenditures but on the high end of the range; and most of the California multipliers for four and more children are generally too high relative to those used in other states. The legislative intent, however, was that the California guideline should be higher than those of other states because of California's relatively high cost of living (Fam. Code, § 4053(1)).

Conclusion 3: Many other assumptions and factors besides measurements of child-rearing expenditures form a guideline formula. These include how the guideline formula adjusts for higher income, obligee income, and shared physical responsibility, as well as the use of gross or net income as the guideline basis. California's approach to some of these factors creates some

²⁰⁹ Various studies estimate child-rearing expenditures. They produce different results as a result of differences in study methodologies, assumptions, and data years. For this reason, state guidelines are typically assessed as appropriate if they are generally bracketed by the lower and upper bounds of credible estimates of child-rearing expenditures.

anomalies and differences from other state guidelines in certain circumstances, but they are generally limited or inconsequential.

The percentage of income devoted to child-rearing expenditures arguably decreases as income increases. As a consequence, most state guidelines, including California's, yield a smaller support award amount when the obligee has more income even though obligor income is unchanged. There are, however, some isolated anomalies under the California guideline resulting from the structure of the combined income bracket of \$801 to \$6,666 net per month.

Many state guidelines, including California's, yield a smaller amount when the obligor has more time with the child and all other circumstances of the cases are unchanged. The amounts calculated under the California guideline change with incremental changes in the timesharing arrangement (e.g., adding or subtracting one or two overnights per month) while some state guidelines do not always change because one or two overnights are added or subtracted.

Whether a state bases its guideline on gross or net income is a policy choice. Regardless of the basis, most states standardize the gross to after-tax income conversion. That is, they use actual tax code to convert gross income to net or back out net income to gross. The latter is necessary in gross-income guidelines because most measurements of child-rearing expenditures relate to after-tax income, not gross income.

Findings From a Review of Case Files

A random sample of 1,226 child support orders entered in 2008 was drawn to analyze how the guideline is being applied, the extent to which it is being deviated, and why the deviations occur. The sample spanned the same 11 study counties as in the last review and ranged in size and socioeconomic factors reflective of the diversity of California. The sample included almost equal shares of IV-D and non-IV-D cases. The preliminary findings were shared with representatives of advocacy groups and commissioners of the study counties in focus group settings to aid in the interpretation of the analysis.

Conclusion 4: The percentage of orders that deviated from the guideline has increased. The 2010 study found guideline deviations in 15 percent of the cases reviewed. Commissioners and stakeholders attribute the increase to the economic recession and better-educated parents.

The 2010 deviation rate is statistically greater than the deviation rates of earlier reviews (i.e., the deviation rate in 1998, 2001, and 2005 ranged from 9 to 10 percent). Most (60 percent) of the deviations result from a stipulation between the parents, and most (69 percent) are downward. In general, commissioners from the study counties believe that deviations increase when there is an economic downturn and parents have less income. For example, some commissioners acknowledged that they deviate in cases where the obligor has very low income and payment of the guideline amount would impoverish the obligor. The advocates also recognized that judges are examining cases individually to determine what parents can realistically pay. Additionally,

advocates suggested that parents are more educated about their potential eligibility for a deviation and are more proactive about requesting it.

Conclusion 5: Commissioners and advocates agreed that the current low-income adjustment is inadequate. Fifteen percent of the obligors in the case file review had incomes below \$1,000 net per month and so were eligible for the low-income adjustment. Despite increases in the minimum wage, this is the same percentage of obligors who were eligible during the last review. It is indicative of the economic distress that many parents currently face as a result of high rates of under- and unemployment and the lack of even low-paying jobs.

The percentage of obligors eligible for the low-income adjustment (15 percent) is the same as in the previous case file review even though the low-income threshold has not changed and the minimum wage has increased. This undoubtedly reflects the economic recession, which has resulted in job losses and reduced other jobs from full-time to part-time work. The adjustment is typically granted more often in IV-D cases than non-IV-D cases. Commissioners suggested that the low-income adjustment may not always be applied in default or stipulated orders. It is also not applied when the obligor's actual income is zero. The adjustment was applied in 59 percent of eligible cases. Commissioners and advocates agreed that the current low-income adjustment is inadequate.

Conclusion 6: Many of the guideline factors designed to yield more responsive orders are being applied very infrequently. A hardship deduction is being made to the incomes of only 4 percent of the parents. Orders for additional support are also infrequent. Orders for work-related child-care expenses are applied in 12 percent of the cases, and orders for uninsured health-care costs, are applied in 18 percent of the cases. Other adjustments to income and orders for other additional support are applied even less frequently. Commissioners attribute these trends to the economic downturn, a higher rate of default orders, and smaller proportion of modified orders in the sample.

In general, permissible subtractions from income (e.g., a hardship deduction because the parent has additional children from a previous or subsequent relationship living with him or her) and orders for additional support (e.g., work-related child care) are occurring less frequently than they did in the previous review. One reason is that parents who do not participate in the order establishment process (as is often the case in default orders) may not know about these adjustments. Other explanations for this pattern are the economic downturn and the types of cases drawn for this study. The commissioners believe that child-care expenses are being ordered less frequently because more parents are unemployed or using relative care. The commissioners also believe that the hardship deduction is applied more often in modified orders than new orders because parents seeking modified orders are more likely to have subsequent families and because the 2008 sample captured a disproportionate share of new orders.

*Conclusion 7: The percentage of orders entered through default, 46 percent, is back up. This is after a concerted effort several years ago to lower the number of orders entered by default in California.*²¹⁰

The percentage of orders entered through default decreased from 44 percent in 2001 to 29 percent in 2005 and then went back up in the 2010 review to 46 percent. Commissioners and advocates attribute the increase to several factors. When the last sample was pulled for the 2005 study, DCSS was engaged in a concerted effort to reduce the incidence of default. Recent cutbacks of DCSS staff, however, may have lessened efforts in this area. Commissioners believe that many defaulted orders are ones in which DCSS requested a relatively low order that the obligor did not contest. Advocates believe that the increase in defaults is due to the economic recession and may reflect the unaffordability of attorney representation for many parents.

Conclusion 8: The percentage of orders involving presumed income has increased since the last guideline review. The percentage of orders with income imputation, however, has not increased. State statute requires that income be presumed in IV-D cases when the obligor's income or income history is unknown. State statute provides that income can be imputed in any child support case (regardless of IV-D status) based on the parent's earning potential.

Income can be presumed for obligors in IV-D cases if there is no information about the parent's income or income history (Fam. Code, § 17400(d)(c)). Obligor's income was presumed in 15 percent of IV-D cases in the 2010 case file review. Income imputation is provided in the California guideline (Fam. Code, § 4058(b)). Income imputation, which is based on the parent's earning potential, decreased from 7 percent during the last guideline review to 3 percent in 2010. Commissioners suggest that the incidence of income imputation has gone down because it is more difficult to show that work is available.²¹¹

Conclusion 9: Health insurance is frequently ordered, and medical support is ordered in most IV-D cases. The latter is important because of new federal medical support rules that became effective in 2008.

An order for at least one parent to provide health-care insurance was made in 80 percent of the cases reviewed. The mother was ordered to provide insurance in 9 percent of these cases, the father in 48 percent, and both parents in 42 percent. The case file data indicate that 95 percent of IV-D cases contain an order for health insurance and/or uninsured health-care expenses.²¹² This is important to fulfill the 2008 federal medical support requirements that require medical support be ordered in most situations.

²¹⁰ As discussed in Chapter 3, default orders are correlated with nonpayment. The general premise is that payments will be higher when parents are engaged in the order establishment or modification process.

²¹¹ Case law (*In re Marriage of Regnery* (1989) 214 Cal.3d 1367) provides a court, when imputing income, should consider whether there is actual opportunity to work, exemplified by an actual employer willing to hire, and other factors.

²¹² As discussed in a Chapter 5, orders for health insurance and/or uninsured health-care expenses are medical support orders.

Conclusion 10: Information is frequently missing from case files. Critical information was missing in many child support cases reviewed for this study. Ten percent lacked documentation of the calendared child support court event; 19 percent did not contain information on the parents' income; 9 percent lacked information on the child support order; and 22 percent did not specify the guideline amount.

Low-Income Parents and Child Support Guidelines

This review considered how other state guidelines addressed low-income parents and why poverty and low-income create special circumstances that need to be addressed in the determination of appropriate guideline amounts.

Conclusion 11: Historically, many IV-D families and obligors have poverty or low incomes. The current high unemployment and underemployment rates likely contribute to even higher incidences of poverty and low income than were previously documented.

Although current California data are not available, national data from 2001 found that one-third of IV-D families had incomes below the poverty level and that about three-fifths had incomes below 200 percent of the poverty level. In 1999, more than 60 percent of California parents with child support arrears had net incomes below \$10,000 per year. The current situation in California is likely to be worse than in other states because of California's above-average unemployment rate (12.5 percent as of February 2010) and underemployment rate (20 percent as of January 2010).

Conclusion 12: When child support obligations are set too high for low-income obligors, they are unable to meet their own subsistence needs. This leads to many severe consequences: a reduced incentive to work and to work in the mainstream economy; depressed child support payments; higher arrears balances; and attenuated parent-child relationships, which in turn, can adversely affect child outcomes.

If an obligor works full-time at the state minimum wage, his or her after-tax income after paying the guideline amount for one child would be below the current federal poverty guideline for one person. In other words, the obligor would have insufficient income to live at least at subsistence level. Some research findings indicate that child support awards that are set too high for low-income obligors may be a disincentive to work and drive these obligors into the underground economy, where their earnings are not subject to immediate wage withholding to pay child support. Still another study finds that arrears accumulate when the obligor's order is more than 20 percent of his or her gross income, particularly at low incomes. As of 2008, almost \$20 billion in child support arrears was owed in California. A previous study of California arrears found that only a small proportion will ever be paid because many obligors have low incomes and because of other factors, such as California's assessment of interest (at a rate of 10 percent), which contributes to arrears growth outpacing payments.

Besides financial consequences, high child support orders for low-income parents adversely affect child outcomes. Most research finds a positive correlation between child support payments and father-child contact. Thus, crafting orders that low-income parents are able to pay is important because, as supported by the research, paternal involvement is significantly associated with reduced rates of out-of-wedlock childbearing, the high school dropout rate, substance abuse, and juvenile delinquency.

Conclusion 13: The California guideline amounts for low-income obligors are high relative to other states. The low-income adjustment under the California guideline is inadequate. Unlike the low-income adjustment used in many state guidelines, it does not relate to the federal poverty guideline for one person. Its income threshold (i.e., the low-income adjustment applies when obligor net income is less than \$1,000 per month) has never been updated. The income threshold is too low to apply to typical low-income situations (i.e., obligors earning minimum wage); hence these low-income obligors are not eligible for the low-income adjustment and payment of the unadjusted guideline amount leaves the obligor with insufficient income to live above poverty level.

In four different case scenarios that considered obligors with no reported income or minimum wage income and a varying number of children, the California guideline ranked 8th, 24th, 13th, and 5th highest among state guidelines. Other states that typically ranked higher than California presumed a higher income when the obligor's income was missing, had a higher state minimum wage, or did not provide a low-income adjustment. Most state guidelines base their low-income adjustment on the federal poverty level for one person or full-time, minimum wage earnings. Some state guidelines index their low-income adjustment to the federal poverty level, which is updated annually. The low-income adjustment under the California guideline does none of these things. It is applicable to net incomes below \$1,000 net. This is below what can be earned from full-time work at the state minimum wage (\$8 per hour; \$1,386 gross per month or \$1,200 net per month). The \$1,000 threshold has not changed since it was first adopted in the early 1990s.

Conclusion 14: California's income presumption policy exacerbates the guideline problems for low-income parents; the obligor's income is often presumed to be more than it actually is or job opportunities available for obligors are presumed to pay more than they actually do.

Family Code section 17400(d)(2) provides that if a support obligation is being established by the local child support agency and the obligor's income or income history is not known, income is presumed at minimum wage for 40 hours per week. Presuming income above an obligor's actual income can produce high percentage orders. (Some California data indicate orders that consume 44 percent of an obligor's net income.) This policy does not recognize that employment opportunities are limited. The statewide unemployment rate is 12.5 percent (as of February 2010) and the statewide underemployment rate, which includes those seeking full-time work who can find only part-time work is 20 percent (as of January 2010). Almost all other states have policies that consider the current job market or presume fewer work hours or that contain other, less-stringent, provisions.

Medical Support Provisions

Child medical support is an integral part of child support. Medical support orders can require insurance coverage for the child by one or both parents, specify how a child's uninsured health-care costs will be allocated between the parents, require payment that is distributed to the Medicaid (or similar agency) if the child is covered by Medicaid (or a similar public entity), or a combination of these types of orders. New federal medical support rules imposed in 2008 necessitate a closer look at state provisions for ordering and modifying medical support.

Conclusion 15: Although the 2008 federal medical support rules impose many new requirements on states—including state provisions for the establishment and modification of medical support—2010 health reform will likely change future federal medical support requirements.

The federal Office of Child Support Enforcement (OCSE) is currently assessing whether current federal medical support policies are congruent with 2010 health reform. They anticipate changes, but the scope of those changes is currently unknown. The 2008 federal medical support rules, however, are currently in effect. Many states, including California, are still adopting and developing changes to conform to the 2008 rules. Cognizant that the federal medical support rules may change in the future, however, many states are making only the minimum changes necessary to fulfill the 2008 requirements.

Conclusion 16: California statute already requires that either or both parents can be ordered to provide insurance coverage for the children and that orders allocate the child's uninsured health-care expenses between the parents. The 2008 federal medical support rule that applies directly to state guidelines mandates that a state guideline provide for how the child's health-care needs will be addressed.²¹³ This encompasses orders for one or both parents to carry insurance for the child, orders for how the child's uninsured health-care expenses will be allocated between the parents, and other types of medical support.

Essentially, the 2008 federal rules eliminate the longstanding presumption that the obligor has employer-sponsored insurance available for children and that it is the most appropriate coverage for the children. Instead, the 2008 rules encourage orders for health insurance from the most appropriate source. This could be the obligee or, at state discretion, a stepparent who has employer-sponsored insurance. The rules also recognize that some of the child's health-care expenses may not be covered by insurance, so an order addressing these expenses may be appropriate. In addition, it recognizes that in some cases neither parents may have employer-sponsored insurance and that the child will be covered through Medicaid (called Medi-Cal in California), SCHIP (called Healthy Families in California), or another public entity's program. California already provides that either or both parents shall carry insurance for the child when it is available at no cost or a reasonable cost to the parent (Fam. Code, § 3751(a)(2)). California

²¹³ 45 C.F.R. § 302.56(3).

also provides for reasonable uninsured health-care expenses in Family Code sections 4062(2) and 4063.

Conclusion 17: California statute currently does not provide an income-based definition of “reasonable cost” but does address what is “accessible” health care. Although not called “cash medical support” (and states are not required to use the federal term), California’s provision of reasonable uninsured health-care expenses is a form of cash medical support. To assist with the implementation of the 2008 federal medical support rule that requires IV-D agencies to petition for health insurance that is reasonable in cost and accessible to the child and/or “cash medical support,” many states are including definitions of “reasonable cost,” “accessible,” and “cash medical support” in their guidelines.

Federal regulation (45 C.F.R. § 303.31(1) & (2)) requires that the IV-D petition for child support include private insurance that is accessible to the child and reasonable in cost and/or cash medical support. Most states that have an income-based definition of reasonable cost are adapting a rate of 5 percent of the parent’s income as the threshold that the child’s premium costs cannot exceed to be deemed reasonable in cost. Although the federal rule is clear that states have the option to define another reasonable income-based standard, the federal rule does suggest 5 percent. Most states that have a definition of “accessible” insurance, like California, consider whether the insurance is geographically accessible to the child. “Cash medical support” can be one of three things, including orders for the child’s uninsured health-care expenses. Most states are fulfilling this requirement for medical support by ordering one or both parents to provide accessible health insurance for the child when it is available at a reasonable cost and including provisions for uninsured health-care expenses in the order (e.g., each parent is responsible for half of the child’s uninsured health-care expenses). (Note: subsequent to the drafting of this conclusion, the California legislature enacted Senate Bill 580 (Wright; Stats. 2010, ch.103) that implemented the federal regulations)

Conclusion 18: The California guideline adjusts for the child’s health insurance differently than do most state guidelines. While most states prorate the child’s share of the insurance premium between the parents, California subtracts the insurance premium from the parent’s income. Depending on which parent pays the premium, the support award is increased or decreased by the other parent’s share. States that have recently replaced the subtraction method for the proration method find that the subtraction method was not a sufficient adjustment for skyrocketing premiums and that the proration method is easy and fair.

The base formulas and schedules of most state guidelines do not include the cost of the child’s health insurance. Instead, most state guidelines consider the actual cost of the child’s health insurance elsewhere in the guideline calculation. It may be subtracted from income or be prorated between the parents. When it is prorated, if the obligor pays the premium, the obligee’s prorated share is subtracted from the base support award; and if the obligee pays the premium, the obligor’s prorated share is added to the base support award.

Input From Stakeholders

The review included three focus groups with stakeholders, mostly representative of custodial or noncustodial parents and/or children's interests. Two focus groups concentrated on stakeholders' perceptions of the guideline's comprehensiveness and fairness. The third focus group called for stakeholders' assistance in the interpretation of the preliminary findings from the case file review. The conclusions, below, are drawn from the first two focus groups.

Conclusion 19: Focus group discussions among advocates reveal that parents frequently fail to comprehend what goes into the guideline calculation and need more education to improve their understanding.

Advocates suggest that parents receive more education about how the guideline is calculated. They believe that when parents fail to understand the factors that go into the guideline calculation, they sometimes distrust the calculation and/or resent the system. They generally believe the calculation is too complex and should be made more transparent. Some advocates suggested methods of outlining the child support formula for parents to review, including a brochure at the court, posting information outside the courtroom, or straightforward information on the court Web site. While some believe that access to online calculators are helpful to the general public, others believe that they create confusion because there are multiple calculators available that can produce inconsistent results.

Conclusion 20: Advocates who attended the focus groups consistently believed that the guideline is unfair to low-income parents.

Many advocates expressed concern about how the guideline treats low-income parents, and low-income noncustodial parents in particular. One advocate summarized the collective opinion of most when he stated that the guideline is "patently hurting low-income people." Advocates support raising the low-income adjustment level. One advocate thought there should be an absolute income floor (irrespective of the poverty level) below which the noncustodial parent would owe no child support.

Conclusion 21: Many of the advocates' issues concerned systematic issues involving the guideline or were beyond the scope of the guideline.

Advocates participating in the focus groups saw the guideline as interrelated and inseparable from other family law issues including custody and court and agency rules and procedures. For example, some advocates believed strongly in presumptive equal custody and that the guideline should reflect that. Still other advocates told stories about problems that parents recently have encountered because they lost their jobs and/or were seeking a modification to their child support order. In all, advocates believed these interrelated issues create parental conflict that is harmful to child well-being. In addition, some advocates proposed to completely revamp the guideline and adopt a new model that did not consider the income of the parents.

Recommendations

Five major recommendations emerge from the research conducted for this guideline review.

Recommendation 1: Update and/or modify the low-income adjustment in the guideline.

The current guideline provides for a low-income adjustment when the obligor's net income is below \$1,000 per month. The \$1,000 threshold has never been updated and, unlike most low-income adjustments in other state guidelines, it does not relate to the federal poverty guidelines for one person or full-time minimum wage earnings. Moreover, it is inadequate, and research findings suggest that it inadvertently could reduce the obligor's incentive to work in the legitimate economy, pay support, and maintain contact with the child, potentially resulting in other adverse consequences to child outcomes.

The income threshold is too low to apply to common situations when payment of the existing guideline amount leaves the obligor with income below poverty level. For example, a minimum wage earner²¹⁴ would not be eligible for the current low-income adjustment. Payment of his or her support award, however (i.e., \$300 per month based on the guideline amount for one child),²¹⁵ would leave the obligor with below-poverty income. That is, his or her income after payment of child support and taxes would be \$900 per month, less than the current federal poverty level for one person. Most low-income adjustments in state guidelines do not have an income threshold for applying the adjustment. Rather, most state guidelines provide that the support award be based on the difference between the obligor's income and a self-support reserve (typically based on the federal poverty guideline for one person) if that amount is less than the standard guideline calculation. This protects the obligor from being impoverished as a result of paying child support. The adjustment is simple and is often incorporated into a state guideline table but is more transparent if it is included in the guideline worksheet.

Some state guidelines also provide that the self-support reserve be updated annually in accordance with annual updates to the federal poverty guidelines. The use of a self-support reserve test, however, necessitates a minimum order when the obligor's income is below the self-support level. For example, an obligor whose income is \$600 per month has income below the current federal poverty level for one person (\$902.50 per month). Some state guidelines provide a minimum order but also specify that an order can be zero in certain situations, such as when the obligor is incapacitated and has no income (e.g., the obligor is institutionalized).

An alternative to adopting the self-support test would be to expand the income threshold of the current low-income adjustment. Several focus group participants suggested expanding the

²¹⁴ Assuming a 40-hour work week and the state's minimum wage of \$8 per hour, this would yield \$1,386 per month in gross income and \$1,200 per month after taxes.

²¹⁵ Assuming the obligee has no income and there is no timesharing or adjustment for other factors.

threshold for its application to \$1,500 net per month. All of the focus group participants unanimously supported a change to the low-income adjustment.

Recommendation 2: Evaluate the current income attribution policies as to both parents This includes codifying case law on income imputation and reviewing the existing income presumption provision to determine if it continues to be consistent with the legislative principles regarding child support.

California's provision for income imputation is thin and lacking in detail relative to those of most state guidelines. However, California case law (*In re Marriage of Regnery* (1989) 214 Cal.3d 1367) spells out what should be considered when imputing income as thoroughly as any other state guideline provision for income imputation. Specifically, it provides a three-pronged test to determine whether a court should consider a parent's earning capacity in lieu of his or her actual income: (1) ability to work, including age, occupation, skills, education, health, background, work experience, and qualifications; (2) willingness to work, demonstrated by good faith efforts, due diligence, and actual meaningful attempts to secure employment; and (3) opportunity to work, exemplified by an actual employer willing to hire. It would benefit guideline users, particularly parents, if this case law were codified. It would improve the transparency of California's income imputation policy and make the guideline outcome more predictable for parents.

California's income presumption policy should be evaluated to determine if it is consistent with the legislative principles regarding child support (Fam. Code, § 4053). The current policy implicitly presumes that obligors in IV-D cases can and should find full-time work at minimum wage. While many states make similar presumptions when imputing income, most states also consider local employment opportunities as part of the process. In addition, if the legislature re-examines the approach to low-income obligors, as recommended in this study, they will need to determine if these changes should also apply to cases in which presumed income is used to determine the child support amount. Further, current law limits the circumstances when income can be imputed to the custodial parent.

Recommendation 3: Educate stakeholders and equip them with information so they can make the current system work better. In addition, develop strategies to engage stakeholders and encourage their active participation in the child support process.

One of the recurring themes of this study is the stress that the economic recession has put on families and obligors. Yet parents are not fully utilizing all of the guideline provisions that are intended to deal with each case's unique economic circumstances. The low-income adjustment is not applied in all cases in which the obligor is eligible. The percentage of parents with hardship deductions is down, even though it seems logical that more parents would need it during an economic recession. Fewer orders are being entered for the child's uninsured medical expenses although parents are losing their employee health benefits. Parents do not understand that their orders are not automatically modified when they lose their jobs. In addition, the findings from

the case file data indicate that fewer parents can learn how the guideline works. Fewer parents are represented by attorneys and more orders are being entered by default, which is an indication that the parent is not involved in the order establishment process. Parents who obtain orders by default typically lack contact with DCSS, family law facilitators, and judges or commissioners—the very people we rely on to educate parents about the guideline. Involvement and education have ripple effects. When parents better understand the guideline, they become engaged in the process, are more forthcoming with information (e.g., documentation of actual earnings or child-care expenses), know when and how to seek a modification, and can understand and use its provisions for unique situations when appropriate (e.g., the low-income adjustment when the obligor is eligible).

Recommendation 4: Adopt any necessary conforming changes so that California can meet the 2008 federal medical support rules that are currently in effect but also recognize that 2010 national health reform may produce changes to the federal rules in the future as well as changes in how states approach medical support.

For the most part, California has the statutory framework needed for California to meet the 2008 federal medical support rules. One possible exception is that California does not provide an income-based definition of “reasonable cost” of insurance in statute. Most states are defining a child’s share of the insurance premium to be reasonable in cost if it does not exceed 5 percent of the parent’s income. Some states recognizing the high cost of insurance set the threshold higher, thereby producing more orders for private health coverage. Still other states concerned about affordability issues set the threshold lower or exclude obligors with poverty or near-poverty income from being ordered to provide private health insurance.

Recommendation 5: Encourage better and more detailed information in the case file.

Income information, order amounts, guideline amounts in orders with deviations, and other pertinent information were missing in a notable number of case files. For some parents, this is the only record they have of the basis of the order. When a parent becomes unemployed or realizes a hardship or another situation that might warrant a modification, it is important that the file contain a complete record of how the court or DCSS arrived at the original order amount.

APPENDIX A

Parental Expenditures for Children: Rothbarth Estimates¹

The continuity-of-expenditures model that underlies child support guidelines attempts to provide children with the same amount of expenditures that the children would have received had they lived with their parents in an intact family. Knowledge of patterns of spending on children in an intact family is required to implement this guideline model. This report will provide estimates of this essential information from the most recent consumption data available from the Bureau of Labor Statistics.

Determining how parents devote the family's spending to their children would seem to be a rather simple and straightforward task: just ask parents to keep track of these expenditures; then ask the parents to determine which expenditures were made on behalf of their children. In application, however, this is difficult. Some consumption goods could be allocated with confidence if they were purchased for a specific individual. For example, the purchase of a pair of shoes could be allocated to the person for whom the shoes were purchased. In other, more complicated cases, spending could be allocated on the basis of a reasonable assumption or based on information gathered in other surveys. For example, consider a family's expenditures for food. While groceries are purchased for the entire family, it is possible to observe individual family members' actual consumption of the meal and then allocate the cost of that meal to each individual family member based on his or her consumption. Alternatively, a food bill could be allocated in proportion to the nutritional requirements of the individual family members. That is, if one member requires twice the nutritional content as another member, a calculation could assume that the first individual consumed twice as much food as the other member.

Allocations are more complicated, however, when the expenditures are not readily divisible by individual family member consumption. For example, it is more difficult to determine a reasonable allocation of expenditures on mortgage, utilities, and other home expenses. One approach to determining an allocation in this scenario would be to average the spending on home expenses and other "publicly consumed" goods across all family members. While this approach has a commonsense appeal, it is based upon a per capita calculation (i.e., dollars spent on a good divided by the number of family members), a method that has been undermined by significant empirical evidence.

Allocating jointly consumed goods on a per capita basis has limitations. For purposes of developing child support guidelines, the "average cost" arguably overstates the "true" cost of the child to the parents. Alternatively, most child support guidelines are developed from estimates of

¹ Prepared by David M. Betson, Associate Professor, Univ. of Notre Dame.

child-rearing expenditures derived from a “marginal cost” approach. The marginal cost approach is based on the concept that the amount of housing or any other jointly consumed good should be the additional amount of housing (or other jointly consumed good) that the parents purchase because of the presence of the children. According to fundamental economic theory on average and marginal cost, if there are economies of scale in housing consumption, then the “average cost” of housing should diminish with increasing family size. Further, if the average cost of housing is falling, then the marginal cost associated with each additional family member should be less than the average cost. In other words, under the marginal cost approach, the cost of the second family member is less than the cost of the first family member, and the cost of the third family member is less than the cost of the second family member, and so forth.

How can the “marginal housing costs” of children be estimated? One commonsense approach would be to calculate the difference in housing expenditures between parents with children and childless couples with the same amount of total spending. While the simplicity of this approach is appealing, economists warn that it will not capture the true marginal cost of housing attributable to children. If children represent an economic cost to their parents, then the childless couple, even though they have the same total spending, will be “wealthier” than the parents with the children. Ignoring the effect of the increased standard of living of the childless couple on their housing expenditures would understate the true marginal housing costs attributable to the children.

One way to calculate housing costs attributable to children is to use the cost of an additional bedroom. For example, consider a married couple with one child who rents a two-bedroom apartment. The difference in rent between the two-bedroom apartment and a one-bedroom apartment within the same apartment complex would be deemed as the housing cost of the child. While a similar calculation would have to be created for those families who own their homes, this approach does have appeal for being direct and easy to understand. However, this approach will only understate the “true” marginal housing costs of children because it does not take into account that a childless couple’s choice in home size is not just the difference between one and two bedrooms. For example, they may have chosen a home with less play room either inside or outside because they do not have a child. In this example, to assume that the presence of the child created a need for only an additional bedroom will understate the housing consumption of the child and consequently understate the cost of a child.²

Most economic studies of child-rearing costs approach the problem of allocating consumption to individual family members in a different manner. Instead of trying to allocate the spending on each consumption item separately, the marginal cost approach asks how much total spending a

² The USDA (Lino & Carlson, *supra* note 20), in its annual reports on expenditures on children, uses the approach that attempts to allocate individual consumption purchases to children. In the past, the majority of the family’s consumption was allocated on a per capita basis. While food, transportation, health care, and clothing were not allocated on a per capita basis, the USDA historically had allocated all other purchases, including housing, on a per capita basis. Only recently has the USDA changed its allocation of shelter and utility spending to reflect a more “marginal cost” allocation.

childless couple would require to be equally well off as two parents and a child with a given amount of total spending. If the childless couple had the same level of total spending as the parents with one child, then they would clearly be materially better off because they did not spend any money on the child. Hence, we would reduce the level of total spending by the childless couple such that they would be as equally well off as the family with a child. The difference in total spending by the two households is interpreted as the cost of the child or the level of spending on the child.

The challenge to the marginal cost approach, however, is how to determine when families of differing composition are equally well off. The two leading contenders are the Engel and Rothbarth approaches. These approaches differ from the previously described approach. Instead of allocating individual purchases to the children, these approaches allocate the entirety of the total spending of the family. In other words, the Engel and Rothbarth estimators are much more of a “top-down” approach than the “bottom-up” approach that common sense may lead one to pursue.

This report is organized as follows. In the next section, the data will be described, as well as the definitions of expenditure categories used in this study. The third section describes the assumptions and methods used by each of the three alternative approaches to estimating parental spending. The fourth section describes how I implemented the Rothbarth model. The empirical estimates derived from the Rothbarth approach will be presented and compared to previous estimates by the author and other researchers in the fifth section. The following section presents a sensitivity test of the major assumptions that I have made to estimate the Rothbarth model. The final section offers some concluding remarks.

Data and Expenditure Categories Employed in Study

The data used in this study are drawn from the Consumer Expenditure Survey (CE) conducted by the Bureau of Labor Statistics (BLS). The survey is based on quarterly interviews of roughly 7,000 consumer units (families). The data are used for the periodic revisions of the Consumer Price Index as well as other economic research and analysis of the spending patterns of American families. The CE is the only nationally representative sample of American families that collects detailed information on the spending habits of families. As such, it is the only available national survey suited for estimating parental spending patterns.

CE Sample Selection Criteria

The data used in this study are from the interview component of the CE beginning in the first quarter of 2004 through the first quarter of 2009. Consumer units are interviewed for five quarters; however, only data from the second through fifth quarterly interviews are reported in the public use files. While the BLS treats each quarterly response as an independent observation, the file used for this analysis is constructed from the BLS quarterly files to reflect a family’s

annual expenditures.³ While any unit can have up to four quarterly interviews, some households cannot be located or refuse to be interviewed and hence will have had fewer than four interviews.

This study was intended to focus on the spending patterns on children in families where both parents were present; consequently, the following sample restrictions were made:

- The consumer unit contained a *married* couple between the ages of 18 and 60 years old;
- The consumer unit contained six or fewer children;
- The consumer unit did not have any other adults (individuals 18 years old or older) present in the unit even if these adults were the children of the couple;
- The consumer unit did not have a change in family size or composition over the period in which the unit was interviewed; and
- Only consumer units with at least three completed interviews were included in the final analysis sample.⁴

These restrictions yielded a sample of 7,846 consumer units where 2,937 observations were childless married couples and 4,909 were married couples with children. Exhibit A-1 presents the distribution of units by the number of children (less than 18 years old).

Exhibit A-1. Sample Observations by Number of Children

Number of children	0	1	2	3	4	5 or 6
Number of observations	2,937	1,511	2,235	869	214	80

Source: Calculations by author.

Given the rather small sample sizes for four and more children, most of the following tables will group families with three and more children into a single category for presentation purposes. While families with four and more children will be included in the analysis, estimates for the cost of children will be presented for one through three children only.

Distribution of Total Outlays⁵

The major focus of this study is an examination of how families allocate their total spending to their children; consequently the first step is to define total spending. The BLS produces two measures of total spending in the consumer unit. The first is their expenditure concept (TOTEXPPQ and TOTEXPCQ), while the other is denoted as the consumer unit's outlays (ETOTALP and ETOTALC). The principle difference between these two concepts is that the

³ See Appendix A-1 for a detailed discussion of the use of annualized quarterly data in lieu of annual data on consumer units, as well as a rationale for basing the analysis on a single annual observation for every consumer unit instead of up to four annualized observations for every consumer unit.

⁴ See Appendix A-2 for the details of how these sample selection criteria, as well as additional sample criteria used in later analysis, affected the size of the analysis sample.

⁵ Appendix A-3 contains a more detailed description of the construction of variables used in this report.

outlay concept includes principle payments for any loans while the expenditure concept does not. Both of the above BLS summary measures include two forms of what most researchers would call savings: payment of social security payroll taxes and payments to retirement plans. For the purpose of this study, these forms of saving were subtracted from both specifications of the family's total spending.

In the past, some estimates have relied on the family's total expenditures as a measure of total spending, but as noted earlier, this concept does not reflect the family's principal payments on their debt, in particular, the principal payments on their home mortgage. The difference between the two measurements (i.e., "outlays," which does include principal payments, and "spending," which does not) is negligible for families with little or no debt or debt that has recently been financed (especially home purchases). However, if the family lives in the same home for a several years, the difference between the two concepts will grow as the mortgage payment reflects more principal payments than interest payments. Since most child support guidelines are intended to provide for children from ages 0 through at least 18 years old, the use of family outlays makes more sense than family expenditures. Nonetheless, the impact of using outlays rather than expenditures on the estimates is examined in more detail later.

Exhibit A-2 displays the distribution of total family outlays by the composition of the family. While the estimates are from interviews conducted from January 2004 through March 2009, all spending and income amounts have been expressed in constant 2006 dollars. Without controlling for available income, families with one and two children on average spend more than childless couples, who on average spend slightly more than families with three or more children. As a percentage of their available income, families with children have more current outlays than do childless couples.

For all family types, the average total spending of the family exceeds the median, indicating that the distribution of spending is not symmetrical around the average but "right skewed." That is, higher-income families spend more than lower-income families. The skewed distribution of both income and spending has implications for the construction of the estimation model. A proportional model based on the log of spending amounts is more consistent with the data than a model based upon levels.

Exhibit A-2. Distribution of Total Outlays by Family Composition

	Childless Couple	One Child	Two Children	Three or More Children
Average net income ⁶	\$64,745	\$65,666	\$68,135	\$60,169
Average total outlays	\$51,428	\$55,968	\$59,096	\$49,491
Average propensity to spend ⁷	79.4%	85.2%	86.8%	82.3%
Total expenditures at:				
5th percentile	\$17,928	\$19,190	\$22,712	\$21,259
25th percentile	31,265	34,482	37,774	34,516
50th percentile (median)	43,855	48,094	52,369	50,370
75th percentile	63,316	67,266	70,771	70,387
95th percentile	168,029	202,781	173,603	205,456

Spending by Expenditure Categories

Exhibit A-3 presents the sample mean of total family outlays by the number of children, as well as the budget share devoted to some of the BLS major consumption categories.

As shown in Exhibit A-3, both the presence and number of children increase the proportion of the family's budget devoted to housing, food, and apparel purchases. For all other consumption categories, the addition of children has no effect on the budget share or lowers the proportion of outlays devoted to that category.

The effect of children on housing is probably most surprising. Exhibit A-3 shows an increase in budget share for housing between a childless couple and a couple with one child (i.e., an increase from 37.9 to 41.2 percent; then it stays at about 41 percent for couples with two and three children). This observed relationship, however, could be an artifact of the way the BLS defines housing purchases to include household operations that reflect the cost of babysitting and child-care services. Exhibit A-4 presents a further breakdown of the housing component into its four components of housing: cost of shelter (e.g., rent or mortgage, home insurance, property taxes, and home maintenance); utilities; the cost of household operations (e.g., maids, gardeners, childcare); and household equipment (e.g., furniture, decorations, and cooking equipment). As anticipated, the largest difference between families with and without children is in the household

⁶ Top-coded values of net incomes were excluded from the calculations. Income is sometimes top-coded for extraordinary high incomes to preserve anonymity of high-income households. "Top-coded income" refers to the replacement of data in cases where the original value exceeds a critical income amount.

⁷ The average propensity to consume was computed as the ratio of average outlays to net income, not the average of the ratio of outlays to net income. If the average of the ratio of outlays to net income is computed, the respective estimates would be roughly five percentage points higher owing to the fact that low-income families typically spend more than their income, resulting in a ratio exceeding 1.

operation segment of housing. Otherwise, the spending on housing for families with and without children is similar.

Exhibit A-3. Average Spending by Family Composition

	Childless Couple	One Child	Two Children	Three or More Children
Total outlays	\$51,428	\$55,968	\$59,096	\$49,491
Budget share (% of total outlays)				
Housing	37.9%	41.2%	41.4%	40.9%
Transportation	20.3	19.9	19.0	18.4
Food	15.7	16.0	16.8	18.3

The exhibits illustrate the difficulty encountered when one attempts to measure child-rearing expenditures by directly allocating consumption spending to adults and children, such as the

USDA does.⁸ As evident in Exhibit A-3, consumption items where it is fairly obvious for whom the purchase was made account for a rather small proportion of all outlays. While adult clothing, alcohol, and tobacco purchases can safely be identified as adult purchases and child clothing, child care, toys, and education might be classified as child purchases, Exhibit A-3 shows that these items would constitute roughly 15 percent of total outlays. The remaining 85 percent of the family's budget would have to be allocated using additional information or assumptions. For food, the USDA approach assumes that food purchases are allocated in proportion to the nutritional requirements of individual family members by age and gender. Using data from the Department of Transportation, the USDA approach first deducts an amount to reflect work-related expenses and then allocates the remainder to the children on a per capita basis. Using data from the Department of Health and Human Services, the USDA approach allocates health-care expenditures in proportion to the expected outlays for children relative to the expected outlays for the family.

Until its 2008 estimates, the USDA approach allocated the remaining consumption items including housing (excluding child care) on a per capita basis. This meant that roughly one-half of the family's outlays were assumed to be allocated to children on a per capita basis. For example, if there are two children in a four-person family, then 50 percent of outlays would be allocated to the children's consumption. This assumption resulted in estimates of the cost of children that were only slightly lower than those calculated on a per capita basis. In its most recent report, the USDA changed its methodology with respect to shelter, utility, and household equipment (furniture) outlays by adopting a "marginal cost" approach. Expressed simply, their current approach is to determine how these housing expenses vary by the number of bedrooms; then it assigns the impact of an additional bedroom to the cost of a child. The new USDA approach also includes an amount toward mortgage principal, whereas its previous methodology did not. While this is a significant departure from their previous methodology, the USDA admits that this approach is a "conservative" one that may actually understate the housing costs that parents may incur when they have children. In the 2009 report, the USDA reports that as a percentage of total spending, parents allocate 27 percent of the family's spending to one child, 40 percent for two children, and 47 percent for three children. This differs little from the amounts in the 2003 USDA report that relied on a per capita allocation of housing. In the 2003 USDA report, the percentage of family expenditures devoted to child rearing were 26 percent, 42 percent, and 48 percent for one, two, and three children, respectively.

Alternative Methodologies for Allocating Family Expenditures to Children

Many of the alternative methodologies for allocating family expenditures to children rely on assumptions that can be even more daunting than the ones employed by the USDA. In this

⁸ Lino & Carlson, *supra* note 20.

section, two competing methodologies used to allocate total family spending to the children are described. The discussion in the body of the report is intended to be nontechnical. The equations presented in the body of the report can be skipped without a loss of general understanding of each approach. Appendixes A-4 and A-5 contain a more technical discussion of these methods.

Indirect Estimates—Engel Method

While the approach taken by the USDA is straightforward and relatively easy to understand, its main weakness is the rather arbitrary manner in which it allocates the family's spending. The use of assumptions that rely on per capita allocations of goods may overstate how much parents truly spend on their children; however, without any other additional information that informs us about how individual members consume or utilize the specific consumption items, what alternative assumptions can be made?

An alternative approach to the allocation problem would be to focus on how parents reallocate consumption within the household in order to make room for their children's consumption. By comparing the consumption decisions of parents with children and married couples without children, the economic costs of the children can be indirectly observed from the differences in consumption patterns. When undertaking this comparison between families with and without children, one should hold everything else constant in the comparison to ensure that any remaining differences can reasonably be attributed to the presence of the children. Some of the factors that should be held constant include the characteristics of the adults, the market prices that families face, and the standard of living or the economic well-being that the two families experience.

The difficulty with this approach is finding a suitable measure of family economic well-being that is constant between the two sets of family. The search for an economic proxy for the family's standard of living has been difficult and not wholly successful. The use of income or even total expenditures in the family are unacceptable measures of a family's well-being. Consider two families that have the same total expenditures or income, but one family has children while the other does not. These families could not possibly be equally well off since, at a minimum, the family with children would have more mouths to feed and more bodies to clothe and shelter.

In searching for a proxy for the family's standard of living, one expectation is that the concept could, in principle, be measured for all families. This restricts the search to goods that are necessities and hence are needed and purchased by all families. One core necessity is food. It was this consumption item that Engel focused on over 100 years ago as an appropriate proxy for a family's standard of living.⁹

⁹ Ernst Engel, "Die Lebenskosten Belgischer Arbeiter-Familien Früher and Jetzt." (1895) 9(1) *Internat. Statistical Bull.*, 1-124.

Being purchased by all families, however, is not a sufficient qualification for a good proxy for the family's standard of living. At a minimum, the proxy should move in the same direction as "known" changes in the family's standard of living. Engel observed that food consumption did indeed meet this additional consideration. A reasonable assumption is that, holding the number of family members constant, increases in the family's total expenditures should make the family better off. What Engel observed was that when total spending increased, the family spent more on food, but the share of food in the family's budget fell.

Comparing families with different numbers of members but the same level of total spending should also create differences in well-being across the families. The expectation is that as the number of family members increased, the family would be worse off. Thus, if food shares are truly an inverse proxy for the family's standard of living, then the budget share should rise with the number of children while holding the level of total spending constant. While the total level of spending was not exactly held constant, Exhibit A-3 shows that as the number of children increased, so too did the share of total spending that the family budget devoted to food.

These observations led Engel and many other researchers such as Espenshade¹⁰ to adopt food shares as a (inverse) proxy for the family's standard of living. When the food share is used as the proxy, this approach is denoted as the Engel methodology. Food, however, is just one component of goods that could be deemed necessities. Housing, clothing, and medical care would fit the economic definition of a necessity. The share of the budget devoted to each of these expenditure categories falls with increased total spending of the family. Because of this, Watts(1977)¹¹ proposed proxies based on this wider set of consumption items other than food. This approach is denoted as the ISO-PROP method.

To illustrate how the Engel model would be implemented, economic data from the CE is first used to estimate a relationship between the food share as a function of total outlays and the number of children (or family size). Exhibit A-5 depicts the estimated relationship between the food share and total outlays for a childless couple ($Kid = 0$) and a family with one child ($Kid = 1$). The graph in Exhibit A-5 corresponds to the Engel assumptions. As total outlays increase, the food share declines. When total outlays are held constant, families with one child will devote a higher percentage of their outlays to food. This latter relationship is depicted by having the relationship for one child to be "above" the relationship for the childless couple at all levels of total spending.

To further illustrate the basis of the Engel method, assume that a family with one child has $TS3$ in total outlays and spends $FS3$ percentage of $TS3$ on food. If the equal food shares are a measure of well-being across family types, then a childless couple with $TS2$ amount of total spending

¹⁰ Thomas J. Espenshade, *Investing in Children: New Estimates of Parental Expenditures* (Urban Inst. Press, 1984).

¹¹ Harold Watts, "The Iso-Prop Index: An Approach to the Determination of Differential Poverty Income Thresholds," in *Improving Economic Measures of Well-Being*, ed. Moon & Smolensky (Academic Press, 1977).

would be as well off as the family with one child and TS_3 of total spending. The difference in total spending, TS_3 minus TS_2 , represents the cost of the child to the parents. If the child was not present, then the one-child family could reduce their spending by the difference and still be as materially well off as they were without one child. Consequently, if the cost of the child corresponds to the amount of total spending the family devotes to the child, then the percentage of total spending devoted to the child would equal

$$\frac{TS_3 - TS_2}{TS_3}$$

Exhibit A-5. The Engel Method

Indirect Estimates—Rothbarth Method

A second indirect methodology is the Rothbarth method.¹² Rothbarth suggested that by examining how adult goods varied by family type and total spending, one could infer how much total spending would be required to make families with and without children equally well off.¹³ This approach is based on the observation that without any additional resources to the family, parents must make “room” for the consumption of their children by reducing purchases that they make for themselves. For the purposes of this study, expenditures on adult clothing are

¹² See Appendix A-4 for a more theoretical justification of the Rothbarth approach and a critique.

¹³ Erwin Rothbarth, “Note on a Method of Determining Equivalent Income for Families of Different Composition,” in *War-Time Pattern of Saving and Spending*, ed. Madge, Occasional Paper No. 4 (Cambridge Univ. Press, 1943).

considered as a proxy for adult spending. If Rothbarth is correct, then spending on adult clothing would fall as the number of children increases. This pattern exists in the CE data used for this analysis; specifically, couples without children spend on average \$2,251 on adult clothing, while parents with one, two, and three or more children spend \$1,787, \$1,541, and \$1,352 respectively.

To implement the Rothbarth approach, data from the CE are used to determine the relationship between spending on adult goods (adult clothing) as a function of total outlays and the number of children in the family. Exhibit A-6 depicts the relationship between spending on adult goods and total spending for childless couples and families with one child. If adult goods are normal goods for families, then as total spending increases, so too will spending on adult goods (i.e., both relationships are upward sloping). If, as Rothbarth suggested, parents reduce their spending on adult goods to make room for spending on children, then, with total spending held constant, the relationship for childless couples should lie above that of the relationship for families with one child, indicating that the presence of children should reduce spending on adult goods.

Again, consider a family with one child who has TS_3 dollars in total spending. It would be predicted to spend AG_3 dollars on adult goods. Note that the level of spending on adult goods is determined by starting on the horizontal axis at TS_3 and then “going up” to the estimated relationship for families with one child ($Kid = 1$) and across to AG_3 . The Rothbarth approach would determine the level of total spending that the equally well-off childless couple would require by asking what the level of total spending is for a childless couple such that they would spend AG_3 on adult goods. Just as in the Engel method, the difference between TS_3 and TS_2 would be identified as the cost of the child and used identically to determine the percentage of the family’s spending, TS_3 , that was allocated to the child.

Exhibit A-6. The Rothbarth Method

Critique of Engel and Rothbarth Methodologies

Although most state guidelines were originally based on the 1984 Engel estimates produced by Espenshade,¹⁴ subsequent research questioned the Engel approach.¹⁵ While Appendix A-5 elaborates on the problems in the Engel method, it suffices to note here that there is growing dissatisfaction with it. While the assumptions of the Engel methodology are consistent with the empirical data, Deaton and Paxson have proposed additional tests of whether food shares are truly a proxy for the family's standard of living. In this study, the data on food shares fail to pass these tests. A second concern pertains to the stability of the Engel estimates over time. After Espenshade's first set of Engel estimates, subsequent Engel estimates first increased and have since declined. The most recent estimates are at a level that is even below that of the original Espenshade estimates. This pattern of estimates over time stands in stark contrast to the relative stability of other estimators of child-rearing expenditures. In previous studies, I have estimated both the Engel and Rothbarth estimates; however, for the purposes of the present study, I will focus on the approach that has a solid theoretical basis and has shown stability over time—that is, the Rothbarth estimator.

¹⁴ Espenshade, *supra* note 14.

¹⁵ Angus Deaton & John Muellbauer, "On Measuring Child Costs" (1986) 94(2) *J. Political Economy* 720–744; Angus Deaton & Christina Paxson, "Economies of Scale, Household Size, and the Demand for Food" (1998) 106 (5) *J. Political Economy* 897–930.

Empirical Implementation of the Rothbarth Model

The following functional form is used to describe the spending patterns of families on adult clothing.¹⁶

$$\ln(A[K, TS, X]) = \mu(X) + \tau \ln(2 + K) + \lambda \ln\left(\frac{TS}{2 + K}\right)$$

In the equation, A denotes the dollar purchases of adult clothing; TS is the total outlays in the family; and $\mu(X)$ is a set of characteristics of the adults in the family and other control variables. For adult goods to be a proxy for the family's well-being, increases in total spending should increase spending on adult goods ($\lambda > 0$). As additional children join the family, with total spending held constant, adult spending (well-being) should decline. This latter condition requires that

$$(\tau - \lambda)\ln(2 + k) < 0 \quad \text{or} \quad \tau < \lambda.$$

Ignoring the impact that the relative age composition has on adult clothing purchases, this restriction will be met if τ is less than λ . This condition does not require τ to be negative.

The first step in the Rothbarth method is to calculate the level of total spending that a childless couple would require so that the couple would spend the same amount on clothing as do the parents with K children and TS_K amount of total spending. For the above functional form, this level of total spending would be equal to

$$TS_o = TS_K \times \left(\frac{2}{2 + K}\right)^{I - \frac{\tau}{\lambda}}.$$

Attributing the difference in total spending as the amount of spending that the parents devote to their children, then the share of total spending that was devoted to the children would be equal to

$$\frac{TS_K - TS_o}{TS_K} = I - \left(\frac{2}{2 + K}\right)^{I - \frac{\tau}{\lambda}}. \quad (2)$$

If $\tau < \lambda$ (with total outlays held constant and assuming that additional children lower spending on adult goods), then the estimated percentage of total spending devoted to the children will be less than their per capita share (33 percent, 50 percent, and 60 percent for one, two, and three children respectively).

¹⁶ Appendix A-6 contains a discussion of alternative functional form assumptions that could be made and reasons this functional form was chosen.

While the Rothbarth method is consistent with consumer demand theory, economists also know that the cost estimate of children it calculates will always underestimate the “true” cost of the children.¹⁷ For the Rothbarth estimates to accurately reflect the cost of children, the family’s decision about spending on adult goods must not be influenced by changes in relative prices of goods. If the family is unresponsive to changes in relative prices when deciding how much to spend on adult goods, the reduction in spending on adult goods when the number of children increases reflects purely a “real income” effect.

To empirically implement the Rothbarth approach, the following variables were used in the estimation of equation 1:

$\mu(X)$ variables:

- black* = 1 if the race of the reference person is black, 0 otherwise
- hnohs* = 1 if the husband doesn’t have a high school degree, 0 otherwise
- hcollege* = 1 if the husband has a four-year college degree, 0 otherwise
- wnohs* = 1 if the wife does not have a high school degree, 0 otherwise
- wcollege* = 1 if the wife has a four-year college degree, 0 otherwise
- ww_wife* = the number of weeks worked in the past year by the wife (range 0 to 52)
- wfulltime* = 1 if the wife worked more than 30 hours per week, 0 otherwise
- bothwork* = 1 if both the husband and wife worked in the previous year, 0 otherwise
- ne* = 1 if the consumer unit lived in the Northeast census region, 0 otherwise
- south* = 1 if the consumer unit lived in the Southern census region, 0 otherwise
- west* = 1 if the consumer unit lived in the Western census region, 0 otherwise
- lnfsize* = log of family size ($2 + K$)
- lnpctout* = the log of total expenditures divided by family size (in \$1,000)
- lnpctout2* = the square of *lnpctout*

The inclusion of the square of per capita total family expenditures allows the share of total spending devoted to the children to vary with the level of total spending. In the previous discussion, this variable was omitted in order to derive explicit equations for the share of total spending devoted to the children. Including this squared term requires other numerical techniques to determine the amount of compensation needed to equate the well-being of families with and without children.

While all of the spending variables were indexed, a series of dummy variables based on the year in which the last interview for the consumer unit was conducted are included. They are:

- y2004* = 1 if the last interview was conducted in 2004, 0 otherwise
- y2005* = 1 if the last interview was conducted in 2005, 0 otherwise
- y2007* = 1 if the last interview was conducted in 2007, 0 otherwise

¹⁷ For the “true” cost to be estimated, the family’s underlying preferences (utility function) must be known, which, of course, will never be known.

$y_{2008} = 1$ if the last interview was conducted in 2008 or 2009, 0 otherwise

where the omitted group was those units whose last interview was conducted in 2006.

To control for the number of interviews that were completed by the consumer unit, three dummy variables in the analysis were included based on the following form:

$complete3 = 1$ if the unit completed only three interviews, 0 otherwise

where the omitted group was those units that had completed all four interviews.

The dependent variable in the Rothbarth approach is the log of the adult clothing purchases in constant 2006 dollars.¹⁸ Families with no reported purchases of adult clothing had to be excluded from the analysis sample (267 observations were dropped). The weighted Ordinary Least Squares estimates of the adult clothing relationship (equation 1) appear in Exhibit A-7.

The Rothbarth approach is based on the assumption that when family size is held constant, spending on adult goods will increase as total spending increases. The Rothbarth method also requires that as the family size increases (i.e., the number of children rises) the adults will reduce their spending on adult clothing. Exhibit A-8 displays the expected amount of spending on adult

¹⁸ See Appendix A-3 for a description of the adjustment made to reported adult clothing to account for the fact that the BLS includes clothing purchases for 16- and 17-year-olds as adult purchases.

clothing for childless couples and families with children.¹⁹ As required by the Rothbarth approach, spending does fall as the number of children increases.

Exhibit A-8. Predicted Expenditures on Adult Clothing as a Function of Total Outlays (in \$1,000) for Childless Couples and Families With Children

Rothbarth Estimates of Parental Spending on Children

Using the regression estimates of the adult clothing equation (Exhibit A-7), estimates of the share of family spending devoted to the children can be computed for different numbers of children as well as for specific levels of total spending. The Rothbarth method utilizing data from 2004 to 2009 yielded 23.5 percent, 36.5 percent, and 44.9 percent as point estimates of the average share of spending devoted to one, two, and three children, respectively, when total spending in the family is \$55,000 (roughly average spending in the analysis sample). This section will first compare these estimates to previous estimates and then will examine how the estimates of the cost of children vary by level of total spending.

Comparing the Current Estimates to Previous Estimates

One of the earliest estimates of the cost of children was based on the 1972–1973 CE data. Espenshade’s estimates of the cost of children using the Engel method published in 1986 were

¹⁹ The figure has been constructed to reflect a couple living in the Midwest where both adults have a high school education and only the husband works.

used by many states to construct their initial child support guidelines in response to the federal requirements set out in the 1988 Family Support Act.²⁰ For families with average levels of total spending, his estimates were that 24 percent, 41 percent, and 51 percent of the family's total spending was devoted to one, two, and three children, respectively. Employing the same CE data but with the Rothbarth approach, an earlier study (Lazear and Michael 1988) produced estimates of the share of total spending of 19 percent, 31 percent, and 39 percent of total spending.²¹ These estimates were considerably lower than the Espenshade estimates and implied more economies of scale in consumption.

The 1988 Family Support Act not only required states to adopt child support guidelines but also directed the U.S. Department of Health and Human Services to conduct research on economic estimates of the cost of raising children. My 1990 study on the cost of raising children represented the department's response to this directive.²² In this study, I estimated the Engel and Rothbarth models (as well as numerous other approaches) using the CE data from 1980 to 1986. This analysis showed that the Engel approach (33 percent, 49 percent, and 59 percent) was almost identical to a per capita allocation. On the other hand, the Rothbarth approach produced significantly lower estimates (24 percent, 34 percent, and 39 percent) than the Engel but higher than the Lazear and Michael estimates. Compared to Espenshade's estimates, while the estimates for one child were identical, my Rothbarth estimates for two and three children were considerably lower and much closer to the Lazear and Michael's Rothbarth estimates. The largest difference between the Rothbarth estimates was for the first child.

In 2000, I replicated my 1990 study using data drawn from the 1996–1998 CE data (first-quarter 1996 through first-quarter 1998). Compared to the 1990 estimates, the Engel estimates (30 percent, 44 percent, and 52 percent for one, two, and three children respectively) showed economies of scale that were absent in the 1990 estimates but were still close to a per capita allocation. While the Engel estimates declined slightly, the 2000 Rothbarth estimates showed a slight increase (26 percent, 36 percent, and 42 percent) over the 1990 estimates.

In 2006, I produced a new set of Rothbarth estimates using data from 1998–2003 CE. The estimated Rothbarth percentages were 26 percent, 37 percent, and 44 percent for one, two, and three children, respectively. While the estimates for one child remained constant, there was a slight increase in the spending shares for two and three children. For this study, I did not produce estimates based on the Engel approach. However, a group of researchers at Florida State University produced a set of Engel estimates using data from the 1998–2001 CE.²³ Their estimates of the share of total spending devoted to children were 22 percent, 38 percent, and 53 percent for one, two, and three children respectively. While the Florida State team employed

different estimation strategies than I did in my studies, the Engel estimates that they produced were significantly lower than my 2000 Engel estimates for one and two children while estimating roughly the same cost for three children. The release of the Florida State study represents the first instance when an Engel estimate (for one child) was less than the corresponding Rothbarth estimate (i.e., my 2006 Rothbarth estimates). A limitation to this comparison, however, is a slight variation in the time period considered in the studies. My Rothbarth estimates encompassed the same time period as the Florida State study as well as a few years of data beyond what the Florida State study included.

Given the standard errors of the estimates of the cost of children (roughly 2 to 3 percentage points based on earlier studies), the difference between the Engel and Rothbarth estimates for one child is not statistically significant. The only statistically significant difference is that for three children (53 percent versus 44 percent). However, the empirical outcome where the Engel estimate is less than the Rothbarth estimate is troubling. It conflicts with a long-standing belief that the Engel approach will always lead to an overstatement of the true costs of children, while the Rothbarth will lead to understatement. For those using the estimates to gauge the adequacy of child support guidelines, this dominant belief has justified the use of the Engel and Rothbarth estimates to bracket the true cost of children. Historically, this belief has never been problematic because the empirical evidence was never to the contrary (i.e., earlier Engel estimates were less than earlier Rothbarth estimates); however, now that the most recent estimates indicate that the upper bound (Engel) is below the lower bound (Rothbarth), it is problematic.

The origin of the “bracketing” thesis was from the paper by Deaton and Muellbauer (1986).²⁴ Assuming the family made a choice between only two goods (i.e., food and all other goods), Deaton and Muellbauer argued that because economists are never able to directly measure a family’s well-being, both approaches would be approximations of the true cost of children. Given the assumption of two goods, where Engel would be based upon food consumption and the Rothbarth would be based on all other goods, they showed that the Engel method would overstate the Rothbarth would understate the true cost of children. By implication, the Engel could never be less than the Rothbarth. While the authors noted that the limitation of their analysis was that it was based on the two-commodity good assumption, many researchers, based upon the empirical estimates, began to generalize the Deaton and Muellbauer result to all situations regardless of the number of goods available for household consumption. Appendix A-5 offers a more detailed critique of the Engel approach and offers an example that demonstrates that when there are three goods, it is quite possible for the Engel not only to be less than the true cost of the children but also less than the Rothbarth estimates. The constructed example is also consistent with the general historical trend in child cost estimates. While the Rothbarth estimates are slightly increasing, the Engel estimates are drastically falling. The conclusion reached in Appendix A-5 is that the Engel model has no theoretical basis and is an ad hoc procedure. As such, there is no reason for it to be well behaved nor trusted to provide evidence of the cost of

²⁴ Deaton & Muellbauer, *supra* note 230.

children. It was for these reasons that I decided not to continue to produce Engel estimates in 2006. But, when pressed to offer Engel estimates, I am sure to warn economists and policymakers of its lack of theoretical foundation and its potential problems.

In 2008, the Florida State team released a second set of Engel estimates using the 2004–2006 CE.²⁵ While the Florida State team does not report the estimated share of total spending devoted to children, I have taken Florida State’s regression model estimates and computed the implicit percentages.²⁶ Based on Florida State’s regression estimates, their Engel estimates were 17 percent, 29 percent, and 35 percent for one, two, and three children, respectively. Compared to my 2006 Rothbarth estimates, the Florida State Engel estimates are lower for each number of children.

The last set of estimates considered in the comparison is the estimates I produced for this study. Earlier, I reported that the Rothbarth estimates using the 2004–2009 CE data were, respectively, 24 percent, 37 percent, and 45 percent for one, two, and three children. While not significantly different from previous Rothbarth estimates using data from 1980 to the present, they are significantly larger than the 2008 Florida State Engel estimates. To investigate whether differences in data sets were responsible for this reversal in estimates, I estimated an Engel model using the data for this study. Without going into the details of the estimation, I will note that the only real difference between the Engel and Rothbarth models is the dependent variable in the multivariate regression model. Instead of using the spending on adult goods (which is the basis of the Rothbarth model), the dependent variable in the Engel model is the logistic transformation of the share of total outlays spent on food at home. The Engel estimates that I produced are 21 percent, 33 percent, and 41 percent for one, two, and three children, respectively. These estimates suggest that it is not the choice of the sample but the method that is producing the results.

The next three exhibits (Exhibit A-9, A-10, and A-11) were constructed to facilitate a comparison of the USDA, Engel, and Rothbarth estimates over time. Exhibit A-9 depicts the historical record of estimates for one child, Exhibit A-10 depicts the historical record of estimates for two children, and Exhibit A-11 depicts the historical record for three children. Since all of the estimates consider multiple data years, each estimate is plotted at the midpoint of the data years. For example, the estimates from the current study used data from 2004 to 2009, so they were plotted for 2006. For comparative purposes, the graphs also include the per capita allocation for each number of children (33 percent, 50 percent, and 60 percent).

The trends in the three exhibits illustrate that the Rothbarth estimates are relatively stable over time while the Engel estimates are relatively unstable over time. Specifically, since the Rothbarth trend line is fairly straight, it is more stable. In contrast, because the Engel trend line fluctuates

²⁵ McCaleb et al., *supra* note 19.

²⁶ The most recent USDA study reports percentages that purport to be from the 2008 study but in reality are the estimation results produced by a graduate student performing a sensitivity test using data from the 1998–2001 CE (the data used in the 2004 study).

up and down, it indicates instability. While my 1990 Engel estimates appear to be high relative to Espenshade's estimates and my 2000 Engel estimates, the differences in estimation procedures between Espenshade and my studies make it difficult to compare his estimates to my 1990 estimates.²⁷ The methods that I employed and those of the Florida State researchers are much more similar, and consequently the trend line could arguably start with my 1990 estimates. Starting at this point, the historical trends clearly indicate that the Engel estimates have been falling over time, while the Rothbarth estimates have been relatively stable, if not slightly increasing, for two and three children.

The ultimate question, however, is which trend line is the most reflective of actual child-rearing expenditures over time. Again, I argue in favor of the Rothbarth estimator over the Engel estimator. As noted earlier, Appendix A-4 constructs a theoretical justification for the Rothbarth methodology and demonstrates that the Rothbarth estimates will likely understate the true cost of children but will never overstate them; and Appendix A-5 demonstrates that because the Engel method does not have a theoretical basis, its properties are unusable. The Engel estimator could overstate or understate the true costs of the children. Its estimates could be greater, or less, than the Rothbarth estimates. In all, the relationship, if any, between the Engel estimator and the true costs of child rearing or the Rothbarth estimator cannot be determined other than to say the Engel estimator is unlikely to reflect the true costs of child rearing. For these reasons and others detailed in Appendix A-5, I cannot recommend using the Engel estimates as the basis of child support guidelines or for assessing the adequacy of child support guidelines. While I cannot purport that the Rothbarth is closer to actual child-rearing expenditures than other estimators, I have confidence in the Rothbarth approach because it does have a theoretical basis and is relatively stable over time.

In addition to tracking the Engel and Rothbarth estimates over time, the exhibits consider the USDA estimates over time. While the USDA annually publishes its estimates, in reality the estimates it releases are not produced anew each year but are updated by inflation adjustment. Consequently, the USDA percentage of total spending devoted to children will not change over time. These percentages will change only when the USDA re-estimates its model by referencing new CE data or changes its methodology as it did when it altered the treatment of housing in its 2008 estimates. With this caveat spelled out, however, the trend lines in the exhibits show that the USDA has always exceeded the Rothbarth estimates and was below the Engel estimates until recently.

²⁷ Espenshade utilized a model that was linear in the food share and total spending, while I used a proportional effect model expressed in the log of food share and total spending. Appendix A-6 describes the differences this alternative functional form assumption implies for the estimation of the cost of children.

Exhibit A-9. Estimates of the Proportion of Spending: One Child

Exhibit A-10. Estimates of the Proportion of Spending: Two Children

Exhibit A-11. Estimates of the Proportion of Spending: Three Children

Marginal Cost of the Second and Third Child

Another consideration for the estimates of the cost of children is how families alter their allocation to the children if additional children are added to the family. For example, consider the situation where the family employs a per capita allocation. With one child, then, the family would allocate 33 percent of the family’s spending to the child. If a second child were added, then a per capita allocation would imply that 50 percent of the family’s spending would be devoted to the children. This infers that a family would spend 50 percent more on their children because of the presence of the second child ($50 \text{ percent} = 100 \times (50 - 33.3)/33.3$). If a third child is added, then 60 percent of the family’s spending would be allocated to all three children and the marginal impact of the third child would be an additional 20 percent in spending. Exhibit A-12 presents the marginal costs of the second and third child for the various estimates.

Exhibit A-12. Additional Costs of the Second and Third Children

	Increase in Child Spending Due to:	
	Second Child	Third Child

Engel (Espenshade 1986)	71	24
Rothbarth (Lazear & Michael 1988)	63	26

The Rothbarth and Engel estimates from the current study represent the first time that I have found the marginal cost of the second and third child to exceed marginal costs reflected in a per capita allocation. In all previous studies, the marginal cost of the second and third child were less than those implied by a per capita allocation. A relatively high marginal cost for the second child may reflect “high” estimates for two children or “low” estimates for the first child. When my

2006 Rothbarth estimates are compared with the Rothbarth estimates from the current study the difference between the cost of one child between the two studies (i.e., 25.2 percent in my 2006 study compared to 23.5 percent in this current study) is responsible for the increase in the marginal cost of the second child. In contrast, the differences in the levels for two and three children are roughly equal between the two studies (i.e., 36.8 and 36.5 percent for two children, respectively, in my 2006 and current studies; and, 43.8 and 44.9 percent for three children, respectively, in my 2006 and current studies).

Estimates by other researchers produce even higher marginal costs for the second and third child (especially for the second child) than my estimates. The sole exception to this observation is the current USDA estimates, which are more similar to my earlier estimates. Those earlier estimates implied marginal costs for a second and third child that are smaller than what is implied by a per capita approach.

Effect of Total Spending

The previous comparisons have focused on the “average family.” The experience of any family will most likely depart from this hypothetical family for factors that are unobservable to the courts and other factors that are, indeed, observable. Other than the number of children, one factor that can easily be discerned is the income of the family. While income may be what the courts will examine, a more appropriate economic comparison is whether child-rearing expenditures vary with total family expenditures. That is, do families that spend more in general also spend proportionally more on their children? The focus on total expenditures rather than income obviates the need to address how tax consequences and household savings decisions affect total family expenditures. This section of the report will examine how parental spending on children differs by the family’s level of total spending.

Exhibit A-13 presents the current Rothbarth estimate of percentage of total spending devoted to the children as a function of total outlays for one, two, and three children. This marks the first of my estimates in which the percentage of total outlays devoted to child rearing increases with total outlays. In all previous studies, I have found that the percentage of expenditures devoted to children declines with total spending. For example, Exhibit A-14 represents the Rothbarth estimates from my 2006 study as a function of the total outlays of the family.

Exhibit A-13. Current Rothbarth Estimates of Parental Sharing by Total Outlays (in \$1,000) for One, Two, and Three Children

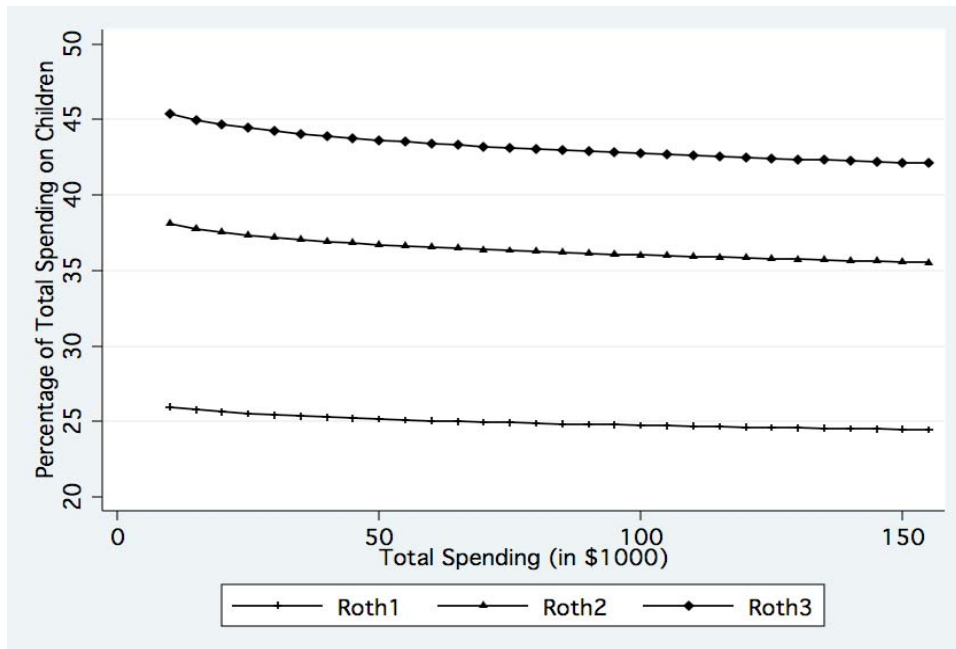

Exhibit A-14. 2006 Rothbarth Estimates of Parental Sharing by Total Outlays (in \$1,000) for One, Two, and Three Children

In my 2006 study, I reported that over time the relationship between the cost of children and total spending had become “flatter,” implying that all families, regardless of total spending, devoted roughly the same percentage of their spending to their children. While the upward trend has continued, I am not certain how much faith to place in the result, even though the increases are statistically significant. My caution is due to the fact that I cannot determine a reason for this result to occur. In my 2006 study, I put forth a possible explanation that was based on problems in estimating a nonlinear relationship between child spending and total outlays when the sample is limited in the range of total outlays. While it is possible that my previously provided explanation is true, I do not find it completely satisfying.

Another possible explanation may lie in the fact that the definition of total spending used in this study and the 2006 study differs from the previous definition used in other studies. In previous studies and the Florida State studies, the measure of total spending reflected the BLS definition of total expenditures, as opposed to outlays, used in this study. The primary difference between outlays (used in the current and 2006 studies) and expenditures is that outlays will reflect the family’s principal payments toward all debt, while expenditures will not. Consequently, for families with debt that are paying off the principal, their level of total spending will be higher than it would have been had expenditures been used as the measure of total spending. When the Rothbarth model is reestimated using expenditures as a measure of the family’s total spending, the result is that as family spending increases, the percentage of spending devoted to the children falls. The decline is statistically significant, although modest in comparison to the declines that I estimated in my 1990 study.

The general conclusion that can be reached from these comparisons is that estimates of spending on children in wealthier families (as indicated by families with high levels of total spending) has been rising relative to what estimates of previous studies would predict. While this could reflect a true increase in spending, the possibility that it is a statistical artifact reflecting sampling variability, extrapolating to levels of spending considerably away from the mean, or the nonlinearity of the relationship between spending on adult clothing and total spending cannot be ruled out. Although there is some evidence that high-income families are spending more on their children today than in the past, the evidence is not conclusive. The analysis prepared for this report indicates that families with high levels of spending are spending a higher percentage of their family’s total spending on their children, but other analyses find that families with high levels of income are spending less of their disposable income today than in the past. Consequently, it is not completely clear whether high-income families are spending more or less today. For example, consider a high-income family who spent 55 percent of their disposable income and allocated 32 percent of their total spending on their two children. If the same family today were to spend 36 percent of their total spending on their two children, the family would have to spend 48.9 percent of their disposable income in order to spend the same dollar amount on their children.

Impact of Alternative Assumptions

So far the discussion has focused on the various methodologies used to measure child-rearing expenditures and the impact of one particular methodology over another on the estimated values. Other assumptions necessary for producing estimates could also affect the levels of the estimates. These other assumptions concern variable definition, functional form choices, and criteria used for inclusion of households in the analysis sample. This section examines the effect of six alternative assumptions on the estimates of the cost of children developed for this study.

To implement the Rothbarth model, I relied on family spending on adult clothing as a proxy for expenditures for adult goods. The CE definition of adult clothing could be problematic, however, because it includes purchases made for older children. The BLS aggregates all apparel expenditures for individuals 16 years and older as adult clothing. To adjust the data for this potential problem, I assigned a proportion of the reported adult clothing purchases to the parents where the proportion is equal to the number of parents (two) relative to the number of family members who were 16 years and older. For example, if the family had one child who was between 16 and 18 years old living in the family, then I would attribute two-thirds of the reported adult clothing to the parents and the remaining one-third to the older child. An alternative choice would be to use the reported purchases of adult clothing.

Another variable definition issue exists in the definition of total spending. As I have noted, I chose to utilize the BLS definition of total outlays minus social security taxes and payments to pension plans. One alternative is to use total expenditures minus social security taxes and payments to pension plans. The difference would be principal payments on debt. In short, the estimates developed for this study include principal payments in the definition of total spending, while the alternative is not to include them in the definition of total spending.

The next two alternative assumptions pertain to functional form. The model developed for this study estimates the effect of the log of family size and the log of per capita total outlays in order to estimate using the Rothbarth model. One alternative would be to estimate separate effects for each number of children by using dummy variables in lieu of using the log of family size. A second alternative would be to control for the log of total outlays instead of the log of per capita total spending. The rationale for examining these two alternatives is that the Florida State researchers employed both of these functional form choices rather than the assumption used for this study.

The final two alternatives relate to the construction of the sample. The Florida State researchers excluded families with top-coded reported incomes. (Top-coding is discussed in greater detail in Appendix A-2.) In this study, a similar exclusion was deemed unnecessary. Typically, observations with top-coded income are excluded when income is a key variable in the estimation; however, this study considered total outlays, not income. Further, top-coded income

does not necessarily imply top-coded outlays. A final point is that excluding families with top-coded reported incomes would significantly reduce the number of cases for analysis.

A second sample restriction that I have consistently employed in this study as well as previous studies is that families must have completed at least three surveys to be included in the study sample. The rationale is that measurement errors in the adult clothing and total spending variables are fewer if there are more data from the consumer. One alternative would be to consider families with four completed surveys; another alternative is to consider all families even if they participated in only one quarterly interview. The latter was explored in this analysis.

In all, 64 ($= 2^6$) variations of the Rothbarth models (as appeared in Exhibit A-7) were estimated by using different combinations of the six alternative assumptions described above. Exhibit A-7 contains the results from one of the 64 sets of estimates. For each set of estimates, I computed the percentage of total outlays devoted to one, two, and three children in a family with \$55,000 of total outlays. To analyze the average effect of each of these six choices, I regressed the estimate of the cost of children on six dummy variables reflecting the choice being utilized to produce that estimate. The six dummy variables were:

ragood = 1 if reported adult clothing purchases is used, 0 if the adjusted purchases is used

expend = 1 if total expenditures is used for total spending, 0 if total outlays is used

kid = 1 if “kid” dummies are used to capture the effect of family size, 0 if log of family size is used

level = 1 if log of total spending is used, 0 if log of per capita total spending is used

topcode = 1 if consumer units with top-coded incomes are excluded, 0 if consumer units with top-coded incomes are included

useall = 1 if all consumer units are included, 0 if only consumer units with at least three completed surveys are included

Exhibit A-15 presents the results of this analysis for one, two, and three children separately.

Source: Calculations by author.

The two alternative variable definitions (i.e., the definition of adult clothing and the definition of total expenditures) do have a substantive and significant impact on the estimates of the cost of children. The use of reported adult clothing purchases instead of some adjustment to reflect the presence of older children will attribute spending on older children to the adults.

Consequentially, the alternative assumption (which does not adjust for some adult clothing being consumed by older children) reduces the estimates of spending on children. The estimates indicate that the effect is substantial and increases with the number of children. The latter makes sense because as the number of children increases, the probability of having older children should increase and so too the problem of using reported purchases.

The use of expenditures in lieu of outlays has a significant impact on the estimates. It increases the estimated cost but seems to be independent of the number of children. One possible explanation is that ignoring principal payments affects the estimates of child-rearing expenditures more so than total spending by the family.

The alternative functional form assumption to control for family size (i.e., dummy variables to represent the number of children instead of log of family size) does not have a substantive impact on the estimates, on average. The use of “kid” dummies, however, is significantly different, but the direction of the difference varies with respect to the number of children. For one and three children, the use of dummies, on average, lowers the cost estimates, while for two children it increases the cost estimates.

Excluding consumer units with top-coded incomes does not have a substantive impact on the estimates, but they are statistically significant for two and three children. The more interesting result concerns the impact of excluding consumer units if they have less than three completed interviews (i.e., the *useall* variable). As discussed earlier, the alternative assumption explored for this analysis was to include consumer units with at least one interview. For two and three children, the alternative assumption raises the cost estimates by roughly 3.3 percentage points. For one child, the effect is smaller (1.2 percentage points) but also significantly different from no effect.

With the exception of the use of adjusted adult clothing purchases, this analysis suggests that the assumptions used to derive the estimates in Exhibit A-7 effectively lower the estimates of parental spending on children.

Conclusions

In this report, I have examined alternative methods of determining the amount of parental spending on children. Each method has its strengths and its weaknesses. The USDA approach is direct and hence more transparent than either the Rothbarth or Engel method. However, with simplicity comes a reliance on assumptions that are certain to be wrong. The Rothbarth method requires other assumptions to identify how much more or less spending families of different

compositions need to maintain a given standard of living. The validity of the Rothbarth assumptions should also be questioned. Nevertheless, given the replication of these and their relative stability over time, both of these methods deserve attention.

Where does that leave policymakers who want to use estimates of child-rearing costs? I would argue that of the approaches that have been examined in this research, it is the Rothbarth method that is the least objectionable. While the assumptions needed to identify this approach are strong, there is no empirical evidence that the assumptions are wrong. Some might object to whether adult clothing, which constitutes less than 5 percent of a family's total spending, provides a reliable basis for estimating the cost of raising children, but given the precision to which the family's decision of how much clothing to purchase is affected by family size, composition, and total spending, the cost of children can also be estimated with a degree of precision comparable to other methods. The only significant problem with this approach lies not with method but with the data.

The findings presented in this report suggest that parental spending on children in families with average levels of spending has not significantly risen or declined since the 1980s. The only exceptions to this conclusion are the Rothbarth estimates for two and three children that have shown a steady increase over time. Given that the estimates for one child have not significantly been changing, these results suggest a loss in the economies of scale in consumption for the second and third children in the family.

A natural question to ask at this time is whether to continue to use the estimates from earlier studies or to move toward the estimates from the current research. This study has been able to construct a sample of sufficient size to increase the confidence in the results, but most importantly, this study has used the most recent data available. Consequently, I can recommend the use of these new estimates for construction of child support obligation tables, with the understanding that they are used in conjunction with recent data on the relationship between family disposable income and family total spending.

APPENDIX A-1

Annual Versus Quarterly Data

The data for this study was drawn from the Bureau of Labor Statistics (BLS) Survey of Consumer Expenditures (CE). This continuing national representative survey samples consumer units and interviews them on a quarterly basis up to five times. The data used for this analysis construct annual family data from families that had at least three interviews regardless of whether the interviews occurred within the same year or different, but consecutive, years.

Only the last four interviews appear in the public use file. A consumer unit may refuse to answer the survey or the BLS is unable to contact the consumer, and consequently fewer than four completed interviews for a consumer unit may be available in the public use file. Additionally, given the sample design, if a fixed calendar period of time is used (e.g., all interviews conducted from January 1 through December 31 of a given year), it is impossible to capture many families who have completed four interviews. Specifically, limiting the sample to a calendar year is likely to result in one out of seven consumer units having completed four interviews, three out of seven consumer units having interviews from the previous year, and three out of seven consumer units having interviews that will be conducted in the next year. This appendix examines whether it makes a difference if the analysis considers expenditure data on a quarterly or annual basis. Specifically, one alternative time unit of observation is the quarter in which each quarter's data is treated as a separate observation.

The BLS recommends that the quarterly interviews be treated as independent samples for analysis. The USDA follows this recommendation when constructing its estimates of the cost of children. In contrast, most economists producing estimates of the cost of children using indirect methods, such as the Engel or Rothbarth, rely on an annual time period and aggregate the quarterly data into a single observation for each consumer unit.

To illustrate the difference between the two approaches, consider an expenditure concept such as spending on adult goods, food consumed in the home, or even total expenditures. Denote this expenditure concept by X and let

X_{qi} = the observation of X for the i th consumer unit from the q th quarterly interview and

Q_i = the total number of quarterly interviews from the i th consumer unit (the maximum number of interviews would be 4).

Assume that the i th consumer unit has only three quarterly interviews ($Q_i=3$) in the sample; hence the i th consumer would appear three times in a quarter-based sample and each quarterly value of X would be "annualized" ($4X_{1i}, 4X_{2i}, 4X_{3i}$). When the quarterly data are annualized for each consumer unit, the consumer unit would appear only once, with a single value for X_{Ai} as

$$X_{Ai} = \frac{4}{Q_i} \sum_{q=1}^{Q_i} X_{qi} = \frac{4}{3} \sum_{q=1}^3 X_{qi}.$$

Annualizing the expenditures by consumer unit eliminates the quarterly variation in expenditures while recognizing that the data are coming from a single consumer unit.

If there is only a small amount of variation across a consumer unit's quarterly observations, the issue of the use of a quarterly versus annual time unit would seem inconsequential. In contrast, if there is significant variation across time for a given consumer unit, the choice of time unit may affect the analysis. This could hold especially true where variation is due to zero expenditures for a particular good in one quarter, while expenditures for the same good are made in other quarters. The variation is likely to depend on the type of the good. For example, although expenditures on food and total expenditures display some variation across time for a consumer unit, they vary little from quarter to quarter relative to expenditures on adult clothing; hence, quarterly differences in food and total expenditures make little difference in the analysis. In a quarterly sample of consumer units consisting of two married adult units with and without children, the coefficient of variation is .17 for total expenditures and .22 for food at home, but 1.01 for adult clothing, roughly five times more than the other two categories. This suggests that an Engel methodology would be relatively unaffected by the choice of time frame, while the Rothbarth could be.

While the remainder of the appendix examines the effect of the choice of time unit for the analysis, it is helpful to recall that indirect measures of the cost of children (i.e., Engel and Rothbarth) reflect the estimation of two separate effects. One effect is the impact of children on the expected value of the consumption of a good (i.e., as measured by the difference in the expected consumption of a good by a unit with a child and one without a child, holding total spending constant). The second effect is the corresponding "income" effect (i.e., how spending on the good changes as total spending increases). Most of this appendix considers the impact of the time period of analysis on the first effect. With regard to the income effect, the use of an annual time period will likely produce less biased estimates compared to the use of the quarterly time unit. To illustrate this, assume that any quarter's value of total spending reflects three components: a permanent component, a transitory component reflecting macroeconomic conditions, and measurement errors. By using an annual time frame, the third component (i.e., the measurement error) should be reduced, and, consequently, so should deviations of the observed value of total spending from its permanent component. If individuals make their spending decisions based on the permanent component of total spending, the use of quarterly data in lieu of annual data should "bias" the estimate of the "income" effect downward. With all other estimates held constant, this should increase the estimated cost of children. It should be noted that, given that there is little variation in total spending for any consumer unit, the expected effect is unlikely to be large. Finally, the question of measurement error in spending on either adult goods or food should not affect the estimates of the cost of children. It will only serve to raise the estimates of the mean squared error in the models.

In my opinion, the case for the use of annual period is unquestionably the right choice. In the remainder of the appendix, I will formally examine how the “sample selection” on the part of the individual consumer units may affect the estimates based on the use of quarterly, as opposed to annual, time period.

Sample Selection and Time Unit

If we compute the mean of annual amounts based upon treating each quarter independently versus using the available data for each consumer to construct its “annual” value of X , the respective means would equal

$$\bar{X}_{Quarter} = \frac{1}{N} \left(\sum_{i=1}^N \frac{Q_i}{\sum_{q=1}^4 X_{qi}} \right) \quad \bar{X}_{Annual} = \frac{1}{N} \left(\sum_{i=1}^N \frac{4}{Q_i} \sum_{q=1}^4 X_{qi} \right).$$

If every consumer were represented in the sample four times (the maximum number of possible interviews), then it is clear that both approaches would yield identical values. However, when some consumers have fewer than four interviews, differences between the two methods will arise and will depend on how completion of the four interviews is related to value of X ,

$$\bar{X}_{Annual} - \bar{X}_{Quarter} = \frac{4}{QN} \sum_{i=1}^N \left(\frac{\bar{Q} - Q_i}{Q_i} \right) \sum_{q=1}^{Q_i} X_{qi} = \frac{4}{Q} \left[\sum_{c=1}^4 \theta_c (\bar{Q} - c) \bar{X}_c \right] \quad (A.1)$$

where

$$\bar{Q} = \frac{1}{N} \sum_{i=1}^N Q_i$$

equals the average number of completed interviews, N_c represents the number of consumer units who have completed c interviews ($c = 1$ to 4),

$$\bar{X}_c = \frac{1}{N_c} \sum_{i=1}^{N_c} \left(\frac{1}{c} \sum_{q=1}^c X_{qi} \right)$$

equals the average quarterly value of X for those have completed c interviews, and $q_c (= N_c/N)$ is the proportion of consumer units that completed c interviews.

If \bar{x}_c is independent of the number of completed interviews (in other words, the average X is the same for all four groups), then it can be shown that

$$\sum_{c=1}^4 \theta_c (\bar{Q} - c) = \bar{Q} \sum_{c=1}^4 \theta_c - \sum_{c=1}^4 \theta_c c = 0$$

and, consequently, both methods of computing the average should yield the same value. However, if there is a systematic relationship between a given number of interviews and the average value of X , then how the average value is computed will influence the value of the mean. If completion of interviews is associated with higher values of X (i.e., as the number of completed interviews increases, \bar{x}_c also increases), then the average value computed from the quarterly observations would exceed the mean computed from the annualized values of X for each consumer unit. However, if there is a negative correlation between completing interviews and the average quarterly value, then the average computed from the “annualized” values would exceed the average, assuming the quarterly observations are independent of each other.

Variability of X and Choice of Time Frame

Assuming that there is no correlation of X with the individual’s decision to complete the interview, is it possible that the quarterly variations of X could create a systematic relationship between the mean of X and the number of interviews completed? This would occur if only nonzero values of X are employed in the analysis, as in the situation when analyzing the $\ln(X)$.

To illustrate this potential source of correlation, assume that X takes on only two values, 0 and X^* , where the value of X^* occurs with probability equal to p . Now, consider that X is positive for purposes of attempting to estimate the annual value of X . For those units who completed only one interview, p percent would have X^* , and the rest would be zero. Consequently the “annual” mean of those units who completed only one interview and had a nonzero value of X would be $4X^*$. Now, for those who have completed two interviews, p^2 would have X^* in both quarters or $4X^*$ on an annual basis. Another portion of the population ($-2(1-p)p$) would have X^* in one period and zero in the other. On an annual basis, this is equal to $2X^*$. The remaining $(1-p)^2$ would have zero X in both periods. The average annual value of X when X was nonzero on observational basis would be

$$\bar{X}_2 = \frac{p^2(4X^*) + 2p(1-p)(2X^*)}{p^2 + 2p(1-p)} = \frac{p^2 + p(1-p)}{p^2 + 2p(1-p)}(4X^*) < 4X^* = \bar{X}_1.$$

In general, for $c > 1$ we can determine the relationship between the mean of X of those with c completed interviews and the mean of X with those who have completed $c - 1$ interviews as

$$\bar{X}_c = \frac{1}{1 - (1-p)^c} \sum_{j=1}^c \frac{c!}{j!(c-j)!} p^j (1-p)^{c-j} 4 \binom{j}{c} X^* = \frac{p(4X^*)}{1 - (1-p)^c} < \bar{X}_{c-1}.$$

Consequently, variability in X can create a difference in the estimates of the mean of X based on annual and quarterly time units that is similar in nature to the differences created by sample selection.

While differences between annual and quarter time periods will exist in the presence of variability of X or sample selection processes, these differences will have an impact on the estimates of the cost of children only to the extent there is a differential effect by demographic factors (e.g., the effect of time unit choice is different for childless couples than for units with children).

APPENDIX A-2

Construction of Analysis Sample

The data for this study was drawn from the Consumer Expenditure Survey (CE) by selecting all of the quarterly interviews conducted from January 2004 through March 2009. This represented 152,289 quarterly interviews. Since the same consumer unit could be interviewed up to four times, the number of unique consumer units is considerably smaller. The initial BLS sample for this time period represented 57,741 separate consumer units.

Since the intent of the analysis was to construct for each observation an annual picture of the family's spending decisions, each family (consumer unit) was characterized based on its characteristics reported in the last quarterly interview that it provided. In turn, the quarterly interviews from previous interviews were respectively used to construct the spending data for each family.

Since the purpose of this study is to examine how married parents living in the same household allocate their total spending to their children, the analysis sample should reflect only husband-wife families. The CE includes a summary variable in the public use file that was used to select only consumer units headed by a married couple. This variable was *FAM_TYPE*, and only those records that had a value of less than 6 were chosen. This selection eliminated single-parent families with children, individual adults living alone, and groups of unrelated adults. This selection criterion eliminated more than half of the original sample (29,413 consumer units), leaving 28,328 consumer units.

The remaining consumer units included a varied group of types of families ranging from families composed of husbands and wives living alone; families living solely with their own children under 18 years old; families living with children other than their own children; families living with children both under and over 18 years old; families living with their own children who were all over 18 years; and families living with relatives such grandparents, aunts, or uncles. Instead of trying to model these complex living arrangements, the analysis sample was limited to two groups of husband-wife families: husbands and wives living by themselves, and husband-and-wife families who were living solely with their own children under 18 years old. This selection was achieved by limiting the total number of adults and nonrelated children to two. This criterion reduced the sample by 6,381 consumer units, leaving 21,947 units in the sample.

The inclusion of childless couples serves as a reference group for the estimation of the cost of children. Consequently, the ages of the husband and wife in these childless couple units should reflect the ages of the parents with children. The age threshold of 60 years old was used to eliminate childless couples who were of the likely age of their counterparts who have children under 18 years old living with them. Eliminating families where either adult was more than 60

years old dropped 5,926 childless couples from the sample and 108 families with children. This left 15,895 families in the sample.

The next sample selection criterion was performed to not allow “outliers” to overly influence our estimates. We dropped from the sample any family with more than six children. This resulted in the loss of 18 families, leaving 15,895 observations in the sample.

The previous selections were made using the information provided from the unit’s last interview. Since the spending information was to be constructed from the previous interviews, any consumer unit whose size or family status changed from the previous interviews was eliminated. For example, a child could have been born, the couple could have become married, or someone could have been living in the unit and left during the prior nine months. The criterion that the size and composition of the unit had to be stable across all of the interviews eliminated another 1,281 families, leaving a total of 14,614 husband-wife families with and without children in the analysis sample. In this sample, there were 5,543 husband-wife families without children and 9,071 husband-wife families with children.

The sample at this point represents the “core sample” for the analysis. In past analysis, two additional sample restrictions were considered. In the CE, the BLS must top-code both income and spending data to protect the confidentiality of respondents. While the identification of the units whose income has been top-coded is straightforward, the top-coding of the spending is extremely difficult to accomplish. In general, the top-coding of the income data represents high-income units, and if they were eliminated from the sample, it would limit the ability to generalize the results from the analysis. However, eliminating these units from the sample may also capture some of those consumer units whose spending data is also top-coded. Eliminating the units whose income has been top-coded reduces the sample by 1,790 families, leaving a total sample of 12,824. This sample is used when considering the impact of alternative assumption. The sample that does not include observations where the family income was top-coded is noted as the “alternative sample.”

In the past, I have produced estimates of the spending decisions of families based on observations of consumer units that included at least three quarterly interviews. As discussed earlier, this criterion was chosen so that the quality of the spending data could be improved if the annual estimate were based on at least three interviews, as opposed to as little as one interview. This assumption was tested by limiting both the core and alternative samples to only those families with three or four completed interviews. This restriction on the sample eliminated 46 percent and 47 percent of the two samples, respectively.

The following table presents the final sample sizes and distribution of observation for the four samples that will be used in the analysis. Note that the analysis reported in the body of the report will primarily reflect the core sample limited by the restriction that the consumer unit must have had at least three interviews.

Exhibit A-2-1. Sample Sizes of the Four Alternative Samples—Husband-and-Wife Families

	Without Children	With Children	Total
Meeting criteria			
Core sample	5,543	9,071	14,614
Alternative sample	4,902	7,922	12,824
Limited to 3 or 4 completed interviews			
Core sample	2,937	4,909	7,846
Alternative sample	2,566	4,217	6,783

APPENDIX A-3

Description and Construction of Variables

This appendix describes the construction of the variables used in this analysis. All variables were constructed using the Consumer Expenditure Survey (CE) conducted in the period starting with first-quarter 2004 and ending with first-quarter 2009.

Adult Goods

For this study I used three variables describing spending on food at home, adult goods, and total spending. The discussion begins with a description of these variables and ends with a description of how annual values of the variables were constructed.

Spending on adult goods is the adults' (parents') purchases of clothing. The BLS provides two sets of variables that capture spending on clothing for adults (*MENSIXPQ*, *MENSIXCQ*, *WOMSIXPQ*, and *WOMSIXCQ*); however, these variables capture spending on clothing made for all members of the consumer unit who are age 16 and older. In the analysis sample, 22 percent of units with children have at least one child who is either 16 or 17 years old; consequently, if there were purchases for clothing for these children, it would appear as an adult expenditure. In the study, I employed two different constructions of adult clothing. The first uses just the reported value of the sum of the above four variables. The second attempts to adjust the reported amounts to better reflect the spending by the parents and not the older children. The adjustment was a per capita adjustment—the amount used in this second version was the reported amount times the ratio of two (the two parents) to the number of unit members 16 years old and older (the two parents and the number of children 16 and 17 years old).

Total Spending

The BLS offers two measures of total spending in the consumer unit. The first is their expenditure concept (*TOTEXPPQ* and *TOTEXPCQ*), while the other is denoted as the unit's expenditures outlays (*ETOTALP* and *ETOTALC*). The difference between these two concepts is that the outlay concept includes principal payments for any loans, while the expenditure concept does not. Both of the above BLS summary measures include two forms of what most researchers would call savings—payment of social security payroll taxes and payments to retirement plans. In our definition of current spending, both of these amounts were subtracted from the above two summary measures to construct our measure of quarterly spending.

After the subtraction of payments to pension plans and social security taxes, the following spending categories are included in the expenditure concept:

- Food: Food prepared and consumed at home, food purchased and consumed away from home

- Housing: Mortgage interest paid, property taxes, maintenance and repair, rent paid, home insurance, utilities, personal services including child care, housekeeping supplies, household furnishings and equipment
- Apparel: Clothing, footwear, cleaning services and supplies
- Transportation: Net outlays for the purchases of vehicles, vehicle finance charges, leases, gas and oil, maintenance and repair, insurance, licenses and other charges, and public transportation
- Entertainment: Fees and admission, entertainment equipment, toys, and pets
- Health care: Health insurance, nonreimbursed expenses for medical services, drugs and supplies
- Tobacco and alcohol
- Personal care, reading, and education
- Cash contributions to individuals outside the consumer unit
- Personal insurance: Life and other personal insurance premiums
- Miscellaneous: Funeral expenses and plots, checking charges, legal and accounting fees, interest paid on lines of credit, home equity loans, and credit cards

Each consumer could be interviewed up to four times. To construct annual spending amounts, first the quarterly (three-month) amounts of spending were constructed from each of the unit's available quarterly interviews. These amounts were then indexed to reflect spending at the midpoint of the time period of the analysis sample. For this purpose, this was assumed to be 2006, and consequently the average CPI for 2006 (201.6) was used as the reference period. Hence, if a unit was interviewed in month t , then each spending amount was indexed to reflect an amount in 2006 by multiplying the spending amount by the following factor:

$$Adjustment_t = \frac{201.6}{(CPI_{t-1} + CPI_{t-2} + CPI_{t-3})/3}$$

Once the available quarterly spending amounts were price adjusted, they were "annualized" by first computing an average quarterly amount based on the available quarterly interviews and then multiplying by four.

Demographic Variables

To be in the sample, the consumer unit could include only two adults who were married. For this analysis, a child was defined to be a member of a consumer unit who was less than 18 years old and was an only child of the married adults. Finally, the sample was limited to husband-wife families with six or fewer children. Consequently, the number of family members in the sample ranges from two to eight. The number of family members was characterized in two alternative ways. The first was to include a variable that was the log of the number of family members (*lnfsize*) that reflects the way that in the past captured the size of the consumer unit. An alternative approach is to provide a series of dummy variables that characterize the number of children in the unit, with the omitted group being childless couples. For this study, the approach was to include the following five dummy variables:

- kid1* = 1 if there is one child in the unit, 0 otherwise
- kid2* = 1 if there are two children in the unit, 0 otherwise
- kid3* = 1 if there are three children in the unit, 0 otherwise
- kid4* = 1 if there are four children in the unit, 0 otherwise
- kid5* = 1 if there are more than four children in the unit, 0 otherwise

To control for other characteristics of the unit, I have included variables describing the parents with regard to their race, education, and work status. Also, I have included variables indicating the region of the country where they were located. In all cases, the data from the unit's last available interview was used to construct these variables. The variables included in the analysis were:

- black* = 1 if the race of the reference person is black, 0 otherwise
- hnohs* = 1 if the husband does not have a high school degree, 0 otherwise
- hcollege* = 1 if the husband has a four-year college degree, 0 otherwise
- wnohs* = 1 if the wife does not have a high school degree, 0 otherwise
- wcollege* = 1 if the wife has a four-year college degree, 0 otherwise
- ww_wife* = the number of weeks (0 to 52) worked in the past year by the wife
- wfulltime* = 1 if the wife worked more than 30 hours per week, 0 otherwise
- bothwork* = 1 if both the husband and wife worked in the previous year, 0 otherwise
- ne* = 1 if the consumer unit lived in the Northeast census region, 0 otherwise
- south* = 1 if the consumer unit lived in the Southern census region, 0 otherwise
- west* = 1 if the consumer unit lived in the Western census region, 0 otherwise

Other Control Variables

While all spending variables were indexed, I included a series of dummy variables based on the year that the last interview of the consumer unit was conducted. The included variables were:

$y_{2004} = 1$ if the last interview was conducted in 2004, 0 otherwise

$y_{2005} = 1$ if the last interview was conducted in 2005, 0 otherwise

$y_{2007} = 1$ if the last interview was conducted in 2007, 0 otherwise

$y_{2008} = 1$ if the last interview was conducted in 2008 or 2009, 0 otherwise

where the omitted group was those units whose last interview was conducted in 2006.

To control for the number of interviews that were completed by the consumer unit, I included the following three dummy variables in the analysis:

$complete1 = 1$ if the unit completed only one interview, 0 otherwise

$complete2 = 1$ if the unit completed only two interviews, 0 otherwise

$complete3 = 1$ if the unit completed only three interviews, 0 otherwise

where the omitted group was those units that had completed all four interviews.

APPENDIX A-4

Theoretical Justification of Rothbarth Approach

The Rothbarth approach to the measurement of the cost of children assumes that parents have well-defined preferences for goods that only they consume and goods consumed by both themselves and their children. To simplify the theory behind the Rothbarth approach, it is assumed that there only two types of goods: adult goods (AG , consumed only by the parents and never consumed by children) and all other goods (O). When the parents (two adults) are childless, the decision of how to allocate their spending between two goods can be characterized as reflecting their desire to maximize their well-being (characterized by a utility function) subject to their ability to meet their wants (the budget constraint). Mathematically, this choice can be characterized as

$$\text{Maximize } U = U(AG, O)$$

$$\text{Subject to: } p_A AG + p_O O = TS$$

where p_A and p_O reflect the market prices of a unit of AG and O , respectively, and TS is equal to the total spending of the couple. All goods other than adult goods, O , represents a composite good that is composed of goods that could be consumed by either adults or children.

The presence of children in the family represents the addition of wants and needs to the family without a corresponding increase in the family's ability to meet those additional wants and needs. If the TS amount of total spending of two adults without children were compared to a two-parent family with a child with the same amount of total spending, it would appear that the childless couple would be materially better off than the couple with a child. (This is without considering the well-being and satisfaction that parents receive from having the child and only considering the well-being derived from the goods that the family can acquire given how much they spend, TS). Specifically, let us assume that the childless couple decides to purchase $p_A AG_o$ dollars of adult goods and $p_O O_o$ dollars of other goods, given they have the ability to spend TS dollars. If the family with the child spent the same amount on the two goods, it makes good sense that they would be worse off because the same consumption is being directed toward more individuals. Only if the composite good were a pure public good would the family with a child be able to avoid a decline in their material standard of living compared to the childless couple.

Barten (1964) provided a framework to formalize the family's additional need for consumption of all other goods (his method allowed the relative needs of different families to vary for all consumption goods), by letting f equal 1 if the couple is childless and a value of ϕ exceeding 1 if a child is present in the family. To model this, need adjusted consumption of the family is assumed to equal $O^* = O/\phi$ for all other goods. Since the need for adult goods will, by assumption, not change for adult goods, the need adjusted consumption for adult goods will

equal $AG^*=AG$. For the purposes of the model, it is also assumed that the family's well-being or standard of living depends upon their consumption of the goods adjusted by the relative needs of the family,

$$U=U(AG^*,O^*).$$

Consequently, if a family without children purchases the same amount of both goods as a family with a child, then it will be better off:

$$U(AG,O) > U(AG,O/\phi) .$$

The Barten transformation of quantities of goods suggests that the parents' decision of how to allocate their consumption given their family structure (with or without children) and the level of family's total spending can be characterized as the following:

$$\text{Maximize } U = U(AG^*, O^*)$$

$$\text{Subject to: } (p_A) AG + (p_O \phi) O = p_A^* AG^* + p_O^* O^* = TS$$

where

$$p_A^* = p_A p_O^* = \phi p_O \quad AG^*=AG \quad O^* = O/\phi .$$

The insight of the Barten reformulation of the consumer model is that additional needs of family that are due to the presence of the child not only directly affects well-being by reducing the adjusted amount of all other goods ($O/\phi < O$) but also results in increasing the relative price of goods consumed by child and adults (O) relative to goods consumed only by adults (AG).

The desired level of expenditures for AG and O can be written as

$$p_A AG = p_A AG(p_A, \phi p_O, TS)$$

$$p_O O = \phi p_O O(\phi p_O, p_A, TS).$$

The presence of a child will have the following effect on consumption decisions in the family (as ϕ goes from 1 to ϕ):

$$\frac{\partial \ln(p_A AG)}{\partial \ln(\phi)} = \varepsilon_{AO} = \frac{\partial \ln(AG)}{\partial \ln(p_O)}$$

$$\frac{\partial \ln(p_O O)}{\partial \ln(\phi)} = 1 + \varepsilon_{OO} = 1 + \frac{\partial \ln(O)}{\partial \ln(p_O)} .$$

Hence, if the demand for other goods is price inelastic ($|\varepsilon_{OO}| < 1$), spending on all other goods will rise and spending on adult goods will decline with presence of a child. It should be noted that if the demand for other goods were elastic ($|\varepsilon_{OO}| > 1$), spending on adult goods could rise because of a reduction in spending on all other goods.

Using the Slutsky decomposition of the cross-price effect (ϵ_{AO}), the decrease in spending on adult goods with the addition of a child is the result of income and substitution effect. When the child is introduced into the family, the child's needs reduce the standard of living of the family and the income effect represents how the family will respond to the decrease in their well-being. The expected result is that both goods are normal, and consequently the family will respond by decreasing their purchases of both goods. The second effect is the substitution effect that reflects the effect of changing relative prices on the family's consumption decision. The consumer model assumes that individuals will always substitute toward goods that get relatively cheaper that in this situation are adult goods. Hence, the substitution effect will counteract the income effect, but for the family's spending on adult goods to decline with the presence of the child, the income effect must dominate the cross-price substitution effect.

Exhibit A-4-1 depicts the theoretical underpinnings of the Rothbarth approach (1941). The horizontal axis in the figure represents the need-adjusted quantities of all other goods (O^*), and the vertical axis represents the needs-adjusted quantities of adult goods (AG^*). Assume that the parents have one child and TS_3 is the amount of total spending. Given the market prices for adult goods and all other goods and the total amount of spending, a family of three faces the budget constraint depicted by the line EF . Note that the vertical intercept represents the maximum amount of adult goods that the family can purchase and is equal to TS_3/p_A^* , which also is al to TS_3/p_A (the children do not increase the needs of adult goods). The horizontal intercept represents the maximum amount the family of three can purchase of needs-adjusted quantities of all other goods required by the needs of the child ($-TS_3/(\phi p_O)$), which is less than what could be purchased by a childless couple. Note that the budget constraint that the adults would face if they did not have the child would be EG . A comparison of budget constraints EF and EG depict what has been previously noted—the presence of a child makes the family worse off in a material sense and the price of all other goods relative to the price of adult goods rises.

The family with the child will allocate their consumption so as to maximize their well-being. In Exhibit A-4-1, this occurs at point B, which corresponds to the family spending $p_A AG_3$ on adult goods and the remainder of their budget on all other consumption. When the family has maximized their well-being at point B, the rate that the family is willing to trade the two goods (the marginal rate of commodity substitution) will equal the “effective” price of all other goods relative to the price of adult goods. This is depicted in the figure by the indifference curve through point B that is tangent to the budget constraint at this allocation of consumption.

Had the parents been childless and spent the same amount on adult goods and all other goods, they would have been better off because the consumption of all other goods would not be “shared” with the child. This consumption bundle is depicted by point C in the figure. However, this consumption allocation will not maximize the well-being of the two adults; they will want to substitute toward more spending on adult goods and less on all other goods. Assuming that they will choose to allocate their spending consistent with point D by spending $p_A AG_2$ on adult goods and the remainder on all other goods, the two adults are materially better off than a couple with a

child. Using this assumption, Rothbarth asked, How much spending can I take away from the couple to make them equally well off as the couple with the child?

Exhibit A-4-1. Illustration of Rothbarth Methodology

Rothbarth's approach was based on knowing the relationship between spending on adult goods, the number of children, and total spending. The following equation assumes that the relationship is

$$AG = AG(K, TS)$$

where K is the number of children in the two-parent family. When the family has one child and TS_3 amount of spending, it will purchase AG_3 units of adult goods (point B when facing the budget constraint EF):

$$AG_3 = AG(K=1, TS_3).$$

If the parents were without the child, they would purchase AG_2 units of adult goods (point D when facing the budget constraint EG):

$$AG_2 = AG(K=0, TS_3).$$

When the total spending for the childless couple is reduced, the budget constraint parallel shifts inward to the origin (relative prices of goods remain unchanged because the family composition is being held constant) until

$$AG_3 = AG(K=0, TS_2).$$

In Exhibit 4-1-1, reducing income or total spending of the childless couple is equivalent to a parallel shift inward of the budget constraint EG to reflect holding the effective prices of adult goods and all other goods constant for the couple. The question is whether the reductions in total spending to reduce the couple's spending on adult goods will leave the couple at point B in Exhibit 4-1-1, corresponding to the budget constraint HJ. If the couple is left at point B, then the reduction in total spending has left the couple with the same needs-adjusted consumption of both goods as the couple with a child and consequently equally well off. However, this will occur only if there is no substitution effect (i.e., the couple does not react to changes in relative prices). If there is a substitution effect, then the couple, when facing the budget constraint HJ, will adjust their consumption by buying fewer adult goods and more of all other goods than the couple has at point B. Consequently, to limit their consumption to AG_3 , a smaller reduction in total spending would have to be made. The budget constraint ST reflects the budget constraint where the couple reacts to changes in relative prices (there is a substitution effect) and after the reduction in total spending purchases, AG_3 units of adult goods. However, as is shown in the diagram, the couple, after this amount of reduction in total spending, would be better off than the couple with the child. This demonstrates the assertion that the Rothbarth method will understate the true costs of a child—the childless couple could experience larger declines in total spending than indicated by the Rothbarth approach and still be better off.

APPENDIX A-5

The Engel Method and Its Critique

The Engel method is based on the assumption that the share of total spending devoted to food consumption is an inverse reflection of the well-being of the family—if a family is better off because of any event, then the food share should decline. When families of identical size and composition are compared, families with more income or total spending do spend a smaller proportion of their total budget on food. When families with children are compared to families without children but have the same amount of total spending, families with children do spend a larger proportion of their budget on food. Armed with these two confirmations of the relationship between the share of spending devoted to food and perceptions of the material standard of living of households, the Engel method suggests that the budget share devoted to food can be used to identify equally well off childless couples and couples with a child. Specifically, the Engel method infers that a childless couple and a couple with a child are equally well-off when each family devotes the same budget share to food even though total spending would be more for the couple with a child. The difference in total expenditures between the families would be attributable to child-rearing expenditures

To illustrate the Engel methodology, let ω_F denote the share of total spending devoted to food and assume that it is a function of number of family members ($2 + K$ where K is the number of children) and the total spending of the family is TS :

$$\omega_F = \omega(2 + K, TS)$$

where

$$\frac{\partial \omega}{\partial K} > 0 \quad \text{and} \quad \frac{\partial \omega}{\partial TS} < 0.$$

If a couple has K children and TS_K amount of total spending, then, by the Engel methodology, a childless couple with TS_O amount of spending would be equally well off where TS_O is determined by equating the food shares across the two family types:

$$\omega(2, TS_O) = \omega(2 + K, TS_K).$$

To provide an explicit example, let the food-share relationship be represented by the following linear equation:

$$\omega(2 + K, TS) = \xi + \alpha(2 + K) - \beta TS.$$

Hence the equivalent level of total spending for a childless couple would equal

$$\xi + \alpha(2) - \beta TS_O = \xi + \alpha(2 + K) - \beta TS_K$$

or

$$TS_O = TS_K - \frac{\alpha}{\beta} K.$$

It is inferred that the difference in total spending in a family with K children and the equivalent spending for a childless couple is the “cost” of the children to the parents and consequently the share of the family’s spending devoted to the children is equal to

$$\text{Share of total spending devoted to the children} = \frac{TS_K - TS_O}{TS_K}.$$

For the specific example used for illustration, the share of total spending devoted to the children is equal to

$$\frac{\alpha}{\beta} \times \frac{K}{TS_K}.$$

The Engel approach has been utilized by numerous researchers, most notably Espenshade (1984),²⁸ whose estimates were used by many states to develop their initial child support guidelines. While the underlying assumptions of the approach seem to be verified by data on family spending, scholars questioned whether there was a theoretical basis for the Engel methodology. Employing the Barten approach to incorporating family characteristics into a consumer demand model through the assumption of commodity-specific economies of scale, Gorman (1976) demonstrated that the Engel methodology would produce accurate estimates of the changes in total spending so as to leave families equally well off as the characteristics of families changed.²⁹ Specifically, as the number of children increased, the family would require an equally proportional increase in each commodity for them to be equally well off. For example, if, after a couple has one child, they would require 30 percent more food to be equally well off, they would also require 30 percent more housing, 30 percent more transportation, and 30 percent more of every commodity. Given the presence of adult goods whose need should not increase with children, it is doubtful that spending data would validate the Gorman condition.

Examining the situation where there were only two goods (i.e., food and all other goods), Deaton and Muellbauer (1986) showed that the Engel methodology would lead to an overestimation of the true costs of the children to the parents.³⁰ Paired with observation that the Rothbarth methodology would always lead to an underestimation of the true costs of the children, the Deaton and Muellbauer paper suggested to many researchers that the Engel and Rothbarth approaches would serve to “bracket” the true cost of children and that the Engel estimates would always exceed the estimates provided by the Rothbarth approach.—

²⁸ Espenshade, *supra* note 14

²⁹ William Gorman, “Tricks with Utility Functions,” in *Essays in Economic Analysis*, ed. M. Artis & R. Nobay (Cambridge Univ. Press, 1975).

³⁰ Deaton & Muellbauer, *supra* note 230.

In their 1998 article, Deaton and Paxson leveled a fundamental critique of the Engel methodology.³¹ Central to the Engel approach is that food consumption is an indicator of the well-being of the family. While I have used the effect of increases in family size and total spending on the food share as tests of Engel methodology, Deaton and Paxson propose a new test. Their reasoning is both unique and complex and revolves around a hypothetical increase in family size that is offset with an increase in total spending that leaves the per capita total spending in the family unchanged. For example, consider that a couple with \$40,000 who is initially childless and then has a child. For the family's per capita total spending to remain constant, their total spending needs to increase by \$20,000 to \$60,000. Assuming any economies of scale in consumption, a couple who has a child but whose per capita income remains constant should be better off—their consumption needs rise by less than their total spending. Using the Barten model of consumer behavior, Deaton and Paxson demonstrate that if this occurs, then per capita spending on food ($F / (2 + K)$ where F is food consumption) should increase. But if per capita total spending is constant, then the food share should increase:

.This observation presents the Engel methodology with two problems. The first is an empirical problem. While the theory suggests that per capita food consumption should increase when family size increases, when per capita total spending is held constant, the empirical data indicates the opposite—that is, it declines. The second problem is even more problematic because it strikes at the heart of Engel methodology—that is, the food share should be inversely related to the well-being of the family. In this situation, when there is an increase in family size, with per capita total spending held constant, the family would be better off, but the food share should rise, not fall, as assumed in the Engel methodology.

The Deaton and Paxson critique of the Engel methodology, in my opinion, undermines any trust that should be placed in estimates based on this approach. Deaton and Paxson best sum up the paradox when they observe, “Although Engel’s method is internally consistent, it directly contradicts the model of scale economies and public goods presented. In consequence, the estimates of the economies of scale that are derived by Engel’s method have no theoretical underpinnings and are identified by an assertion that makes no sense.”³²

To illustrate the potential problems of the Engel approach, a particular index of well-being denoted as the Linear Expenditure System (LES) is assumed that also assumes families will need a level of consumption of goods that varies by commodity. For this illustrative example, three goods are assumed: adult goods (x_A); food (x_F); and all other goods (x_O). The index of well-being for this formulation of the family’s preferences is equal to

³¹ Deaton & Paxson, *supra* note 230.

³² *Id.* at p. 903.

$$U = \beta_A \ln\left(\frac{x_A}{\mu_A} - \phi_A\right) + \beta_F \ln\left(\frac{x_F}{\mu_F} - \phi_F\right) + \beta_O \ln\left(\frac{x_O}{\mu_O} - \phi_O\right)$$

The parameter ϕ will denote the level of need by a childless couple for each of three goods, and we will assume the following values:

$$\phi_A = 500 = \text{needed amount of adult goods}$$

$$\phi_F = 4,000 = \text{needed amount of food}$$

$$\phi_O = 12,000 = \text{needed amount of all other goods}$$

The parameter μ denotes for each commodity the relative needs of a family with a child relative to a childless couple. Given that children are assumed not to consume adult goods, then μ_A would equal 1.00; however, for food and all other goods we expect a family with a child would require more food and all other goods. It is assumed that a family with a child needs 35 percent more food ($\mu_F = 1.35$), implying some economies of scale in consumption, compared to the situation where no economies of scale exist and food consumption needs would rise by 50 percent ($\mu_F = 1.50$). The relative needs for all other goods, μ_O , will be allowed to vary in the calculations from a value of 1.25 to 1.45. By definition, the value for all the μ 's for a childless couples are equal to 1.00.

The parameters β 's reflect the relative weights to consumption of adult goods, food, and all other goods are assumed to be equal to .10, .20, and .70, respectively. The family is assumed to maximize their preferences subject to the budget constraint where TS is assumed to be given

$$P_A x_A + P_F x_F + P_O x_O = TS$$

and p_i reflects the price of the i th good. For these calculations, we will assume that all prices are equal to \$1.

Since the representation of the family's preferences is known, the relationship for the true cost of achieving a given level of standard of living can be derived. It is equal to

$$MS + \lambda U$$

where

$$MS = \text{minimum level of spending} = \sum p_i \mu_i \phi_i$$

$$\lambda = \prod \left(\frac{p_i \mu_i}{\beta_i} \right)^{\beta_i} = \text{one over the marginal utility of income, and}$$

$$U = \frac{TS - MS}{\lambda} = \text{utility or standard of living.}$$

For childless couples, the minimum level of spending equals \$16,500, given our assumptions. For a family with one child where μ_F equals 1.35 and μ_O equals 1.30, the minimum level of spending equals \$21,500, or \$5,000 more than the childless couple.

The equivalent level of spending for a childless couple compared to a family with one child and TS_3 is equal to

$$TS_2 = \sum p_i \phi_i + (TS_3 - \sum p_i \mu_i \phi_i) \times \prod \left(\frac{1}{\mu_i} \right)^{\beta_i} .$$

The corresponding equation for the food share is

$$\omega_F = \frac{P_F X_F}{TS} = \beta_F + \frac{P_F \mu_F \phi_F - \beta_F \sum p_i \mu_i \phi_i}{TS} .$$

And, consequently, the Engel method would lead to the following equation determining the equivalent total spending for childless couples, TS_2 :

$$TS_2 = \sum p_i \phi_i + (TS_3 - \sum p_i \mu_i \phi_i) \times \prod \left(\frac{1}{\mu_i} \right)^{\beta_i} .$$

The Rothbarth method requires that the level of spending on adult goods is equated across the families. Given the LES preferences, the spending on adult goods is equal to

$$\omega_F = \frac{P_F X_F}{TS} = \beta_F + \frac{P_F \mu_F \phi_F - \beta_F \sum p_i \mu_i \phi_i}{TS} .$$

Hence, the Rothbarth estimate of TS_2 would equal ($\mu_A = 1.0$ for both childless couples and families with one child):

$$TS_2 = TS_3 - \left(\sum p_i \mu_i \phi_i - \sum p_i \phi_i \right) + \frac{p_A \phi_A (\mu_A - 1)}{\beta_A} = TS_3 - \sum_{i \neq A} p_i \phi_i (\mu_i - 1) .$$

To summarize, the assumed LES preferences for the family whose parameters are equal to

$$\begin{aligned} \beta_A &= .10 \quad \beta_F = .20 \quad \beta_O = .70 \\ \phi_A &= 500 \quad \phi_F = 4,000 \quad \phi_O = 12,000. \end{aligned}$$

The price of each good is assumed to be \$1. To account for differences in family sizes, a Barten scale of the consumption of each good is assumed where the following scaling factors were employed for childless couples and families with one child:

Childless couples	$\mu_A = 1.00$	$\mu_F = 1.00$	$\mu_O = 1.00$
Families with one child	$\mu_A = 1.00$	$\mu_F = 1.35$	

The relative need for all other goods (μ_O) will be allowed to vary from 1.25 to 1.45. Finally, it is assumed that the family with one child has \$50,000 of total spending. Exhibit A-5-1 utilizes the above equations for determining the equivalent total spending for a childless couple—that is, the “true” cost using the LES utility function, the Rothbarth approach, and finally the Engel

methodology. When examining the calculations, I offer one word of caution. While the “true” cost estimates look similar to estimates seen in the empirical literature, the computed levels are not of interest and should not be interpreted as point estimates. What is of interest among these calculations is the ordinal ranking of the estimates—in particular, whether the Engel and Rothbarth estimates bracket the “true” costs of the child.

Exhibit A-5-1. Alternative Estimates of the Cost of a Child Assuming the LES Preferences

	Alternative Values of μ_O :			
	1.30	1.35	1.40	1.45
“True” cost	22.3%	24.4%	26.4%	28.2%
Rothbarth method	10.0%	11.2%	12.4%	13.6%
Engel method	36.4%	28.6%	18.6%	5.4%

As the relative needs for all other goods increases for families with a child, with the other factors held constant, not unsurprisingly the cost of the child rises. While, as expected, the Rothbarth estimates of the share devoted to the child is less than the “true” costs, they too rise as these needs increase. It is the Engel method that yields the most troubling pattern—while the other two methodologies produce increases in the estimate of the child’s share of total spending, the Engel method reveals a decline in the child’s share as the need for all other goods increases. While the needs for all other goods is less than or equal to additional needs for food ($\mu_O \leq \mu_F$), the Engel estimate exceeds the “true” cost of the child, and the Deaton-Muellbauer bracketing of the “true” cost by the Engel and Rothbarth methodologies is realized. However, if the relative needs for all other goods exceeds that for food ($\mu_O > \mu_F$), the child’s share of total spending predicted by the Engel method becomes less than the “true” cost of the child and the bracketing is not realized. As the additional needs for other goods rise even more, however, the child’s share determined by the Engel method declines so much that it is less than the Rothbarth estimate.

Appendix A-4-1 describes the rationale underlying the Rothbarth methodology using the Barten model of family scaling of consumption. This model captures the impact of family size and composition on the family’s consumption decisions as price effects—that is, as the family size increases the need for some goods rises faster than others and, consequently, become more expensive relative to other goods. The price effects of family size have two effects. The first effect is that as goods become more expensive there is an income effect reflecting that the family is worse off because of their increased consumption needs. The second effect is a substitution effect as the family substitutes away from goods that have become relatively more expensive.

In the calculations prepared for this report, it has been reasonably assumed that families with children do not need more adult goods than childless couples but do need more food and all other goods. Consequently, in the comparison between families with one child and childless couples,

the “price” of adult goods does not change and is the “cheapest” good in all of these calculations. The relative price of food to all other goods is changing in these calculations. When μ_O is less than or equal to μ_F , food is relatively the most expensive commodity for the family with a child, but as μ_O increases all other goods become the most expensive commodity. This suggests that as long as adult clothing and food represent the cheapest good and most expensive good for families with a child, the Rothbarth and Engel methodologies will bracket the “true” cost of a child. When food is no longer the most expensive good, the Engel method will no longer overstate the “true” cost of a child and, as seen, can be less than the result of the Rothbarth method.

What is most troubling with these comparisons is the counterintuitive result found in the Engel comparisons. If the child’s consumption needs were increasing, the costs of a child should rise. While both the “true” cost and Rothbarth measures reflect this, the Engel estimates go in the opposite direction, indicating lower costs as needs increase. This makes no sense at all.

While the Engel methodology has a long history, I do not believe that any trust can be placed in the estimates derived by this approach or any other iso-proportional approach using composite commodities based on necessities such as food, clothing, and shelter. These considerations have only strengthened my conviction that the Rothbarth approach is the superior alternative methodology to pursue.

APPENDIX A-6

Functional Form Assumptions

The Rothbarth approach assumes that the number of children and the family's total spending affect the level of spending on "adult" goods and that by examining these relationships it is possible to estimate family spending on children. To estimate how the number of children and total spending affects spending on adult goods, it is necessary to make assumptions about the nature of the relationship between these two variables and other variables that would be thought to affect the level of spending on adult goods. For example, whether the parents work or not might affect the level of spending on adult goods, which would include the parents' clothing purchases. The region of the country might also affect spending on adult goods.

This discussion examines the impact of alternative functional form assumptions on estimates of the share of total spending devoted to children based on the Rothbarth methodology. However, many of the conclusions drawn in this discussion apply equally to the Engel or any other iso-prop methodology with the sole difference being that the relationship between family size, total spending, and the iso-prop measure of well-being (the food share in the case of the Engel method) will differ. For example, while the Rothbarth assumes that family size will be negatively correlated with spending on adult goods, it will be assumed to be positively correlated with food share. In this appendix, I will be focusing on husband-wife families with and without children. Consequently, variation in family size is in reality a reflection in the number of children present in the family.

However, a generalized relationship between spending on adult goods (AG), family size ($FS = 2 + K$, where K is the number of children), total spending (TS), observed other factors (Z), and unobserved factors determining spending on adult goods (ε) can be generalized as

$$AG = F(FS = 2 + K, TS, Z, \varepsilon)$$

where the Rothbarth methodology assumes that

$$\frac{\partial F}{\partial K} < 0 \quad \text{and} \quad \frac{\partial F}{\partial TS} > 0.$$

If a family with K children has TS_K total spending, then a childless couple with all the other characteristics (Z and ε) identical to the family with children would be equally well off if they had a level of total spending TS_o where

$$TS_o \text{ such that } F(2, TS_o, Z, \varepsilon) = F(2 + K, TS_K, Z, \varepsilon)$$

and, consequently, the share of the family's total spending, TS_K , devoted to the children would be equal to

$$CS = \frac{TS_K - TS_o}{TS_K}.$$

Without further specification of the function, F , what determines the share of total spending going to the children is unknown. A typical assumption that is made is that the number of children and total spending are additively separable from other factors determining adult spending. Specifically, this implies

$$AG = F(FS, TS, Z, \varepsilon) = G(F, TS) + H(Z, \varepsilon).$$

Assuming this form of separability, it can be seen that the equivalent level of total spending, TS_o , will depend on the number of children and the total spending of the family with children and not on other factors:

$$TS_o \text{ such that } G(2, TS_o) = G(2 + K, TS_K).$$

Hence, the proportion of spending devoted to the children will not be affected by the factor Z or ε . I am not aware of any study that has not made the above assumption. For the purpose of establishing child support guidelines this assumption is not problematic because if it were not made, the choice of other factors (Z) would need to be made and would theoretically affect the guideline amounts.

I now turn to how the specific choice of functional form for G will affect the share of total spending devoted to the children (CS). The question is whether the effect of the number of children or total spending on the purchases has either a constant absolute effect or constant proportional effect.

For this investigation, the first assumption is a constant absolute effect that would be the case if it were also assumed that household preferences were consistent with the linear expenditure system. While Espenshade employs an Engel approach to the estimation of spending on children, he also assumes that the effect of children and total spending (income in his case) has a constant absolute effect on spending. This assumption is referred to as the linear specification. Specifically, it is assumed that G is equal to

$$\text{(linear specification): } G(FS, TS) = \alpha FS + \delta TS \quad \text{where } \alpha < 0, \delta > 0$$

which implies that

$$TS_o = TS_K + \frac{\alpha K}{\delta}$$

and

$$CS = -\frac{\alpha}{\delta} \left(\frac{K}{TS_K} \right).$$

The share of spending on children will increase with the number of children but decline with increases in total spending of the family with children. The marginal effect of an additional child on the children's share (for example, the marginal effect of an additional child would reflect the

change from one child to two children) is smaller for families with higher levels of total spending but is independent of the number of children.

$$\frac{\partial CS}{\partial K} = -\frac{\alpha}{\delta} \left(\frac{1}{TS_K} \right) > 0 \quad \frac{\partial^2 CS}{\partial TS \partial K} = \frac{\alpha}{\delta} \left(\frac{1}{TS_K^2} \right) = -\frac{CS}{TS_K} < 0 \quad \frac{\partial^2 CS}{\partial K^2} = 0.$$

The marginal effect of a change in total spending in the family with children is negative but becomes less negative with increases in total spending:

$$\frac{\partial CS}{\partial TS} = \frac{\alpha}{\delta} \left(\frac{K}{TS_K^2} \right) = -\frac{CS}{TS_K} < 0 \quad \frac{\partial^2 CS}{\partial TS^2} = -2 \frac{\alpha}{\delta} \left(\frac{K}{TS_K^3} \right) = 2 \frac{CS}{TS_K^2} > 0.$$

Now assuming that the impact of family size and total spending has a proportional effect on spending on adult goods, the two simple functional forms consistent with this assumption are to assume that G is equal to

$$\text{(log-linear specification): } G(FS, TS) = e^{\phi + \beta FS + \gamma TS}$$

or

$$\text{(log-log specification): } G(FS, TS) = e^{\phi} FS^{\chi} TS^{\eta}.$$

Each of these two specifications can be written alternatively by taking the log of AG and assuming that the effect of other factors (Z and ε) also have a proportional effect on total spending:

$$F(FS, TS, Z, \varepsilon) = G(FS, TS) H(Z, \varepsilon).$$

These assumptions imply that the log of adult spending will equal

$$\text{(log-linear specification): } \ln(AG) = \phi + \beta FS + \gamma TS + \ln[H(Z, \varepsilon)] \text{ where } \beta < 0, \gamma > 0$$

$$\text{(log-log specification): } \ln(AG) = \phi + \chi \ln(FS) + \eta \ln(TS) + \ln[H(Z, \varepsilon)] \text{ where } \chi < 0, \eta > 0.$$

Since equating the levels of spending on adult goods is equivalent to equating the log of spending levels, the formula for the proportion of spending on children is equivalent to the computed proportional spending on children using the constant absolute effect model

$$\text{(log-linear specification): } CS = -\frac{\beta}{\gamma} \left(\frac{K}{TS_K} \right).$$

The reader should not conclude that this would result in the same estimated coefficients from regressing the level of adult spending on family size and total spending as from the regression of the log of adult spending on the same two variables, holding constant the same other factors. However, the ratio should be roughly the same unless the functional form choice does truly affect the estimate of the ratio. This might occur because, when using the linear specification, the

estimates, α and δ , reflect the average effect of family size and total spending at the mean of the sample, while in the log-linear model, they would reflect the marginal effects at the median observation.

The choice of the log-log specification provides an alternative of the proportion of total spending on children. In the log-log formulation the share of total spending devoted to the children equals

$$CS = 1 - \left(\frac{2}{2+K} \right)^{-\frac{\chi}{\eta}}.$$

The difference between the alternative specifications should now be evident. While in both the linear and log-linear specifications increases in total spending in the family will decrease the share of total spending on children, changes in total spending do not affect the children's share in the log-log specification. I want to emphasize that these relationships reflect functional form assumptions and not any empirical facts. The share of spending devoted to the children will depend solely on the number of children and is not a function of the total spending of the family. As the number of children increases, then the effect on the children's share of total spending will be equal to

$$\frac{\partial CS}{\partial K} = -\frac{\chi}{\eta} \left(\frac{1}{2+K} \right) (1-CS) > 0 \text{ if } \chi < 0 \text{ and } \eta > 0.$$

The marginal effect of an additional child on the children's share of total spending will diminish as more children are added to the family:

$$\frac{\partial^2 CS}{\partial K^2} = \frac{\chi}{\eta} \left[\frac{1-CS}{(2+K)^2} + \frac{1}{2+K} \frac{\partial CS}{\partial K} \right] < 0.$$

Interpretation

Now I consider the case where the size of the family does not affect adult spending (i.e., α , β , and χ are all zero). If the data supported this finding, then the proportion spent on the children would be estimated to be zero. Under the Rothbarth logic, if the adults are not found to reduce their spending as the number of children increases, then they are not spending on their children. However, it could be the case that the parents are reducing their consumption of nonadult goods or goods that are jointly consumed with the children to make room for the purchase of goods that will be solely consumed by the children. It is this observation that leads many to conclude that the Rothbarth methodology will tend to underestimate the true costs of children.

As α , β , and χ become negative or more negative, the children's share of spending rises. If it is believed that a per capita sharing of resources represents an upper limit (in reality, however, it is not because parents could choose to spend more on their children than they do on themselves),

then there should be a relationship between the effect of additional children (α, β, χ) and the effect of additional total spending (δ, γ, η). For the linear specification, the marginal reduction in spending on adult goods owing to additional children ($-\alpha$) should be less than the per capita total spending in the family with children times the effect of total spending on adult goods (δ):

$$-\alpha \leq \delta \frac{TS_K}{2 + K}.$$

For the log-linear specification, the logical restriction on the effect of additional children is identical to the linear specification but uses the corresponding parameters (β, γ):

$$-\beta \leq \gamma \frac{TS_K}{2 + K}.$$

Testing of these restrictions is difficult because they depend not solely on parameter values but also on the level of per capita total spending in the family. The log-log formulation of the adult-good-spending relationship has a clear advantage because the restriction on parameters can be made solely on the basis of parameter values. Specifically, the restriction that the estimate of the amount of sharing is less than or equal to per capita sharing can be stated as

$$-\chi \leq \eta.$$

In my past empirical work, I have employed the following functional form for the log of adult spending:

$$\ln(AG) = \phi + \pi \ln(FS) + \eta \ln\left(\frac{TS}{FS}\right)$$

which can be rewritten as

$$\ln(AG) = \phi + (\pi - \eta) \ln(FS) + \eta \ln(TS).$$

The second formulation shows the equivalency between the two log-log specifications ($\chi = \pi - \eta$), and consequently, if χ is to be negative and less in absolute value than η , then

$$0 < \pi < \eta.$$

The reason for preferring this specification (holding per capita total spending constant) versus the specification holding total spending constant is the direct interpretation one can give to π . The children's share of total spending is equal to

$$CS = 1 - \left(\frac{2}{2 + K}\right)^{1 - \frac{\pi}{\eta}}.$$

The term π/η represents the economies of scale in consumption that will range from 0 to 1. When π/η is zero, then the children's share will be their per capita share, but as π/η increases, their share will decline until it equals 1, where, in fact, there are “-infinite“ economies of scale in consumption—the children are “free.”

Mixtures of Functional Forms

Finally, there is a mixture of the log-linear and log-log specifications that have been employed or suggested to be used. Specifically, the Florida State researchers, in their estimation of the Engel model, have employed a model where the log of adult-good spending is linear in the number of children and linear in the log of either total spending or per capita total spending.

The formulation that is linear in family size (children) and linear in the log of total spending can be characterized as

$$\ln(AG) = \phi + \kappa K + \mu \ln(TS) + \ln[H(Z, \varepsilon)] \text{ where } \kappa < 0, \mu > 0$$

where the associated children's share of total spending would equal

$$CS = 1 - e^{-\frac{\kappa K}{\mu}}$$

This functional form shares the same characteristic with the log-log specification, that the children's share of total spending is independent of the level of total spending. The effect of an additional child on the children's share is

$$\frac{\partial CS}{\partial K} = -\frac{\kappa}{\mu} e^{-\frac{\kappa K}{\mu}} = -\frac{\kappa}{\mu} (1 - CS) > 0$$

which also implies, like the log-log specification, that the marginal effect of an additional child on the children's share will be negative:

$$\frac{\partial^2 CS}{\partial K^2} = -\left(\frac{\kappa}{\mu}\right)^2 (1 - CS) < 0$$

A closely related functional form would also assume that the effect of family size is linear, but instead of holding total spending constant, it holds per capita spending constant:

$$\ln(AG) = \phi + \nu K + \theta \ln\left(\frac{TS}{FS}\right) + \ln[H(Z, \varepsilon)] \quad \theta > 0$$

The children's share of total spending that corresponds to this functional form is

$$CS = 1 - \left(\frac{2}{2 + K}\right) e^{\frac{\nu K}{\theta}}$$

which is an interesting mixture of the previous functional form and the log-log specification.

Given an expectation that there will be economies of scale for children's consumption, it can be anticipated that there is to be a positive income effect ($\theta > 0$), and consequently the effect of the number of children should be non-negative ($\nu \geq 0$). If n is zero, then the children's share is the

per capita share, but as n becomes positive, then the children's share of total spending declines, holding the number of children constant:

$$\frac{\partial CS}{\partial v} = -\frac{K}{\theta} \left(\frac{2}{2+k} \right) e^{\frac{v}{\theta} K} < 0$$

As the number of children increases, the children's share of total spending will increase:

$$\frac{\partial CS}{\partial K} = (1 - CS) \left[\frac{1}{2+K} - \frac{v}{\theta} \right] > 0 \text{ if } v < \frac{\theta}{2+K}.$$

However, it is possible for the children's share to fall as the number of children rises. The marginal effect of an additional child depends on the number of children, but if the marginal effect is positive, then as the number of children increases, the marginal effect should decline:

$$\frac{\partial^2 CS}{\partial K^2} = -\frac{1-CS}{(2+K)^2} - \frac{\partial CS}{\partial K} \left[\frac{1}{2+K} - \frac{v}{\theta} \right] < 0.$$

Deciding Between Functional Forms

While this discussion has highlighted the impact of alternative functional form assumptions, the data also need to be examined to determine which specification is more consistent with the empirical evidence. From the analysis sample that I constructed for this report, I have plotted the amount of spending on adult goods versus the amount of total spending in husband-wife families with two children. To be included in any of the plots, the family must have had at least one dollar of spending on adult goods. The following three graphs show the relationship between these two variables for the linear model (Exhibit A-6-1), log-linear model (Exhibit A-6-2), and the log-log specification (Exhibit A-6-3).

Exhibit A-6-1. Scatterplot of Linear Model

Exhibit A-6-2. Scatterplot of Log-Linear Model

Exhibit A-6-2. Scatterplot of Log-Log Model

While this is not a formal test, the scatterplots can be used to identify which model best corresponds to the assumptions of classical regression analysis. Specifically, some of the scatterplots may reflect more or less variation around a line.

In Exhibit A-6-1 (linear specification), it can be seen that estimates of the effect of total spending on adult goods will be difficult to estimate. Given that spending on adult goods is, in practice, limited to total spending, as total spending rises, not only does spending on adult goods rise but also the variance of spending on adult goods. Recall that the data will be used to estimate the effect of total spending on adult goods, and the more variation in its estimate will correspond to greater variation in the estimates of the children's share of total spending regardless of the precision in the estimates of the effect of children on spending.

Exhibit A-6-2 (log-linear specification) clearly displays a nonlinear relationship between the log of adult spending and the level of total spending in the family. Estimating a linear total spending effect would overestimate spending on adult goods at low and high levels of total spending. While quadratic terms of total spending could be included to account for the nonlinearity in the effect of total spending, perhaps a simple transformation of total spending would be preferable.

The log-log specification (Exhibit A-6-3) does just that and is the closest to depicting the relationship between the two goods that would have created by the assumptions of the classical linear regression model. While an eyeball inspection of this transformed data indicates there still may be a slight nonlinear effect of total spending on adult goods, the clustering of the scatterplot

suggests that this functional form specification is more consistent with the data than the other two specifications.

I would suggest that this provides sufficient evidence (and there is also evidence from similar scatterplots for other family types, such as childless couples and husband-wife families with different numbers of children, that produced the same results) to adopt the log-log specification. However, this evidence does not suggest which formulation of the basic log-log or mixture formulation is the most appropriate. To let the data tell this would require a complicated non-nested hypothesis test. I am not proposing to do such a test but reserve it for future research. Until that test is performed, I will examine the effect of alternative functional forms in the estimates.

Modifications to Basic Log-Log Specification

As it is probably evident from this discussion, I do have a clear favorite. It is the log-log specification, where total spending is represented by the log of per capita total spending and the number of children is reflected in the log of family size:

$$\ln(AG) = \phi + \pi \ln(FS) + \eta \ln\left(\frac{TS}{FS}\right) + \ln[H(Z, \varepsilon)].$$

The children's share of total spending implicit from this functional form is

$$CS = 1 - \left(\frac{2}{2 + K}\right)^{1 - \frac{\pi}{\eta}}.$$

While this is a fairly simple model, one might question two features. One potential concern is that the level of total spending does not affect the children's share. The easiest fix is to include the square of the log of per capita total spending in the model:

$$\ln(AG) = \phi + \pi \ln(FS) + \eta_1 \ln\left(\frac{TS}{FS}\right) + \eta_2 \left(\ln\left(\frac{TS}{FS}\right)\right)^2 + \ln[H(Z, \varepsilon)].$$

If η_2 is found to be significantly different from zero, then the children's share will become a function of the level of total spending. Unfortunately, with the nonlinearity of the log of per capita spending, it is not possible to derive an explicit function for the children's share of total spending. However, it can be shown that the children's share will be negatively related to total spending (holding the number of children constant) if η_2 is negative (assuming that η_1 is positive, which means that families with higher levels of total spending will have smaller effects of increases in per capita total spending).

APPENDIX A-7

Estimate of Engel Model

The dependent variable *lnfshare* is the log of the budget share of food at home relative to the budget share of all other goods.

APPENDIX B

Sampling and Data Collection

Sampling Time Frame

The sampling time frame for the study included cases with filings and orders during the time period January 1, 2008, through December 31, 2008. This calendar year allowed for a sufficient amount of time to pass prior to data collection to ensure that action would be taken on the cases.

Sampled Counties

Collecting data required a review of case files. As a result, it was not feasible to include all 58 California counties. The 11 counties that were selected are the same counties that participated in the 2005 study.

Exhibit B-1. County Population and Orders Established Relative to State Totals				
	Population (2008 Estimate)¹	Percentage of State Population	Number of Orders Established in 2008²	Percentage of Orders
Large counties				
Alameda	1,537,719	4.1%	2,106	2.1%
Fresno	928,066	2.4	5,246	5.3
Los Angeles	10,301,658	27.2	20,823	20.9
Santa Clara	1,829,480	4.8	3,234	3.2
San Diego	3,131,552	8.3	3,918	3.9
Medium-sized counties				
San Luis Obispo	268,290	0.7	959	1.0
Solano	424,397	1.1	1,319	1.3
Tulare	433,764	1.1	2,211	2.2
Small counties				
Amador	38,035	0.1	149	0.1

² Cal. Dept. of Child Support Services, "Comparative Data for Managing Program Performance," *Federal Fiscal Year 2008* (Apr. 2009).

The large counties in the study are Alameda, Fresno, Los Angeles, Santa Clara, and San Diego. The medium-sized counties are San Luis Obispo, Solano, and Tulare. The small counties are Amador, Siskiyou, and Tehama. As shown in Exhibit B-1, the five large, three mid-sized, and three small counties participating in the study account for 50 percent of the state's population and 40.7 percent of the child support orders established in 2008.

Exhibit B-2 shows selected economic indicators from the sampled counties. Five of the 11 counties have unemployment rates that fall below the state average, and 2 have mean annual wages that are above the state average.

Exhibit B-2. Economic Profile of Selected Counties

Sample Sizes

The target sample size was 1,000 cases. This would be adequate to measure the deviation rates, changes in the deviation rates, and changes in the deviation rates by various subgroups. The sample of 1,000 cases was weighted across the counties to create a proportional representation. Los Angeles County was separated from the very large and large counties because of its inordinate share. Los Angeles represents 38.3 percent of all cases in large and very large counties. Rather than use 38 percent in proportional sample, the sample used 20.9 percent because Los Angeles accounts for 20.9 percent of statewide establishments. For other sampled counties, the cases sampled represent the county's proportion of large, medium, or small counties. For example, 54.5 percent of all establishments occur in very large and large counties. Since Alameda, a large county, has 14.5 percent of establishments among the sampled counties, the weight for Alameda County is 7.9 percent (54.5 percent multiplied by 14.5 percent) of all targeted cases.

Exhibit B-3. Weighted Sampling of Cases by County							
	Orders Established (FFY 2008)¹	Orders by County-Size Category	Statewide Total	Sampled Counties Total	Weighted Sample	Targeted Sample	Total Sample
Very large							
Los Angeles	20,823	38.3	20.9	51.2	209	250	20.9
Large counties

Tehama	495	5.1	0.5	56.3	55	66	5.5
Sum of sampled counties	40,695				1,000	1,199	
Rest of state	59,078						
State total	99,773						

¹ (Cal. Dept. of Child Support Services, *Comparative Data for Managing Program Performance: Federal Fiscal Year 2008*, Data and Performance Analysis Branch, Sacramento, California, Table 3.12.

Given the anticipation that some cases would have to be excluded because of missing data, the courts were asked to oversample by 20 percent. The target sample (including this 20 percent oversample) is shown in Exhibit B-4. Exhibit B-4 also shows the final number of cases per county that could be used in the final data analyses. As the table shows, only two counties, Siskiyou and Tehama, fell short of the minimum weighted sample goal.

Exhibit B-4. Minimum Weighted Sample Goals by County			
	Minimum Weighted Sample Goal	Targeted Sample (includes 20% oversample)	Cases Usable in Analysis
Large counties			
Los Angeles	209	250	262
Alameda	79	95	97
Fresno	197	236	237
Santa Clara	121	146	164
San Diego	147	177	180
Medium-sized counties			
San Luis Obispo	32	38	51
Solano	44	52	54
Tulare	73	88	97
Small counties			
Amador	17	20	20
Siskiyou	26	31	16
Tehama	55	66	48
Sum of sampled counties	1,000	1,199	1,226

Courts were instructed to evenly divide the sample between IV-D and non-IV-D cases. A 50/50 split was used in previous guideline studies. There was no clear evidence to support the substitution of a different split in this study.

Exhibit B-5 shows the number of cases in the analysis broken down by IV-D or non-IV-D status. The shaded cells indicate those counties where the sample goal was not met. Both Siskiyou and Tehama fell short of the number of non-IV-D cases that could be included. Although a precise breakdown of each county by IV-D status is not available, available data do indicate that both of these counties had only about 1,000 cases in 2008 that had never received TANF.³³ These would be the only potential non-IV-D cases, and, of course, some of these custodial parents might have

³³ Cal. Dept. of Child Support Services, *supra* note 155.

applied for IV-D services. In other words, a very small pool of potential non-IV-D cases was available for inclusion.

Exhibit B-5. Sample of Cases by County and IV-D Status				
	IV-D Minimum Goal	IV-D Cases Usable	Non-IV-D Minimum Goal	Non-IV-D Cases Usable
Large counties				
Los Angeles	104	129	104	132
Alameda	39	48	39	48
Fresno	98	119	98	117
Santa Clara	60	83	60	81
San Diego	73	92	73	88
Medium-sized counties				
San Luis Obispo	16	28	16	23
Solano	22	28	22	26

Total	581	540	1,121	45	38	83

Exhibit B-7 shows the case file review definitions and instructions used by data collectors in the study counties. Cases were selected randomly.

The data collectors used a case file review tool (i.e., Exhibit B-8) to manually record information found in the case files. To protect confidentiality, the data collection instruments did not contain any personal identifying information (e.g., names, social security numbers) from the case files. Completed data collection forms were submitted to the contractor for data entry and analysis.

**Exhibit B-7. Review of Statewide Uniform Child Support Guideline 2010
Case File Review Instructions and Definitions**

SAMPLING AND VALID CASES

This study will consist of a random sample of cases filed between January 1, 2008 and December 31, 2008 in which child support was an issue. Cases will be pulled to examine if there is a child support order.

A current child support order is defined as an ongoing order for the support of one or more children that was calculated using the California child support guideline. A current child support order is not an arrears-only order or an order for payment of health insurance. These orders were not calculated using the guideline.

The study is limited to orders subject to the California child support guideline. Do not abstract Uniform Interstate Family Support Act (UIFSA) child support cases unless the order is established or modified by a California court. Also excluded are cases in which an order has not yet been established and ordered where the combined family support and child support could not be separated using the information in the case file.

If there are several orders within a year, please use the most recent one to complete the case file review form.

In most cases, the AOC project manager has provided the court liaison with an electronic spreadsheet of cases to pull. Courts have been asked to separate Title IV-D and non-Title IV-D cases. Courts will be asked to pull fifty percent IV-D and fifty percent non-IV-D cases. Courts have been instructed to pull three times the targeted sample quota to allow for cases that might not be usable because of missing information or if a case is unavailable at the time.

For instance, Tulare County has a targeted sample of 88 cases. The reviewer's goal will be to collect 44 completed forms for IV-D cases and 44 forms for non-IV-D cases. A case will not be considered reviewed unless the reviewer can complete the case file review form. If he/she exhausts the primary list of cases and still has not yet met the quota, he/she will move on to the secondary list of cases and the tertiary one, if necessary. In this example, the court would have pulled a total of 264 cases. If the reviewer still cannot fulfill his/her quota after reviewing cases from these three lists provided by the AOC, the court will then start going through the general list of randomized cases until the targeted sample has been met.

REQUIRED AND MISSING INFORMATION

The purpose of this study is to determine if the statewide child support guidelines are being followed and if not, why not. The following information **MUST** be specified, either on the mandatory forms or shown in a court-generated child support calculation printout:

- Parents' income, both gross and net;

- Amount of base child support ordered;
- Whether or not the child support ordered is the guideline amount; and
- If the child support ordered is above or below the guideline.

Do not guess on any of the above or make your own determination. It must be specified in the court file.

If the sampled court event is missing any of the above information, you may go back one court hearing to review documents for the required information pursuant to that establishment or modification of child support. If the case is a new order and there is no additional information, return that case to be refiled. Complete only Section I, Case Information, and Section IV, Missing Information. Again, this will not be counted in your case file quota. For example, if you are required to extract 100 cases, and you have twenty-five where you could only complete Sections I and IV, then you will need to collect data on twenty-five more cases to meet the quota. (Review the section on Sampling and Valid Cases for information on how to pull additional cases.)

Make a reasonable effort to find missing information. Keep in mind, though, that we have estimated that it will take approximately fifteen minutes to extract data for each valid case. If you find you are spending significantly more time than that to complete a valid case because you are hunting through the file for missing information, move on.

Court liaisons were asked to pull three times the targeted sample. For example, if your quota of completed cases was 100, the court contact was asked to pull 300 cases for review. If you have reviewed all of the files pulled for you by the court liaison and you still have not reached your quota of valid, complete cases, you will need to ask your court contact to pull more files for you, as specified by the AOC protocol. You will need to estimate how many more case files to pull for you to meet your case quota. Remember, you must attempt to complete fifty percent of your total quota as IV-D and fifty percent as non-IV-D cases.

AOC project manager will provide instructions on where to send completed case file review forms.

DEFINITIONS

SECTION I: CASE INFORMATION

1. County: Specifies the county that entered the child support order. This must be a county in California among the eleven counties selected for this study: Alameda, Amador, Fresno, Los Angeles, San Diego, San Luis Obispo, Santa Clara, Siskiyou, Solano, Tehama, and Tulare. If the order originates from another state, it does not qualify for the case file review.

2. Order Date: This is the date the order was entered. It must be between January 1, 2008, and December 31, 2008, to qualify for the case file review.

3. Case #: This is the number assigned by the court.

4. Type of Case

Title IV-D Case: Case in which IV-D services for current child support were being provided at the time the order was entered, indicated by local child support agency attorney appearance, or that it is an “in-and-out” order (FL-632 Notice Regarding Payment of Support). If an independent action is filed (FL-645 Notice to Local Child Support Agency of Intent to Take Independent Action to Enforce Support Order), it is still considered a IV-D case. A IV-D case includes a family law case or Uniform Parentage Act (UPA) case in which the local child support agency has intervened.

Non-Title IV-D Case: Case in which the local child support agency was not providing IV-D services for current child support at the time the order was entered.

5. New Order or Modification

New Order: The initial order or provision in a judgment for child support (since it could be a default judgment and not the result of a motion). A new order would include any order, including orders at further hearings that were the result of the initial request for child support. There is no motion to modify. The motion is to enter an order.

Modification: Any order entered subsequent to the entry of the initial child support order (new order – see above). There should be a motion or a stipulation to modify in the case file.

6. Order Type

Default: No responsive papers filed, and no court appearance by respondent/defendant, and no written stipulation or verbal stipulation taken on record. If the order after hearing has the “Uncontested” box checked off, it should also be categorized under “Default.” It is **uncontested** if the order after hearing has the “Uncontested” box checked off.

Contested: Responsive papers filed and/or court appearance and no written stipulation or verbal stipulation taken on record. The different scenarios are as follows:
Responsive papers filed AND court appearance AND no written or verbal stipulation taken on record;

Responsive papers filed AND no court appearance AND no written or verbal stipulation taken on record; or

No responsive papers filed AND court appearance AND no written or verbal stipulation taken on record.

Stipulation: There must be a signed stipulation or order indicating that a stipulation was taken on record.

SECTION II: PARENT INFORMATION

7. Approximate % of Child's Time With Parent: This refers to the percentage of time used to calculate the order amount.

8. Imputed Income: Income not based on actual earnings but based upon the court's determination of a party's ability to earn. Income may be imputed for either parent.

9. Presumed Income: No information is available regarding a party's actual income or income history and the court bases its order on the provision of Family Code section 5002.

10. Parents Represented: Answer yes only if represented by private counsel. Local child support agency is not representing parent.

11. Amount of Base Support Ordered: Amount of child support ordered exclusive of additional support as defined in Family Code sections 4061-4062. Any order for \$0 or a determination of no ability to pay child support should still be considered a child support order. If there is a "no ability" finding, enter \$0.

Other terms follow what are in Judicial Council Forms.

**Exhibit B-8. Review of Statewide Uniform Child Support Guideline 2010
Case File Review Form**

SECTION I: CASE INFORMATION

1. County: _____ 2. Order Date: ____ / ____ / _____
(Must Be Between 1/1/2008 to 12/31/2008)

APPENDIX C

Calculation of State Guideline Comparisons

State guideline amounts for four case examples were calculated for this study. In Case A, the obligor's income is unknown, the obligee's income is zero, and there is one child. In this case, the income presumption policy of a state's guideline is the basis of the obligor's income. If the state's guideline (or statute in California) does not specify the amount of income to be presumed, the state's minimum wage is used. If a state's guideline does not specify the hours worked in the provision, a 40-hour work week is used.

Case B is the same as Case A except for one difference. It assumes that the obligor works 40 hours per week at the current federal minimum wage of \$7.25 per hour. In other words, there is no variation in the obligor's income among states on account of differences in state provisions for income presumption, state minimum wage, or both. Other assumptions of Case A and Case B are identical; that is, the obligee's income is zero and there is one child.

Case C also assumes that the obligor works full-time at federal minimum wage. However, Case C considers the guideline amount for two children rather than one child, as in Case B. Case D also assumes that the obligor works full-time at federal minimum wage. Case D considers the guideline amount for five children.

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

	Commentator	Comments												
1.	Law Offices of Aaron O. Anguiano Aaron O. Anguiano Attorney	I am not clear if the calculation of the hardship exemption factor is 1 when one parent is supporting the child alone or 1 when both parents are supporting the child together because some attorneys and judges say that a parent is only entitled to one-half of the hardship exemption if the other parent of the child subject to the hardship exemption is also contributing to the support of said child. We need to be educated in this issue. Thanks.												
2.	California Alliance for Families and Children Paul Stroub Executive Director	<p>Dear Sirs and Madams:</p> <p>California Alliance for Families and Children agrees that it is vital that children need to be supported emotionally and financially by both parents after a divorce or separation. We believe that California's child support guidelines should be reasonable and fair to all involved parties. We also believe a financially fair guideline is an important aspect to reducing conflict at all stages of the child's youth until the child reaches an age of majority. Fairness would help reduce motivation for a tug of war between the parents for custodial control. This is a factor that we believe is on both sides of the parental disagreement.</p> <p>During the review of the Statewide Uniform Child Support Guideline for 2010, there was no mention of the inequities that are produced by some of the mechanical applications of the guideline formula due to mathematical errors in the assumptions for this model.</p> <p>Principally, the significant error that is created is that all child costs are assumed to be directly related to the time spent with the respective parent. This is a faulty application of the economics of the respective household's situation and is ignored in the guideline formula and law. The error that we are expressing is related to costs that do not change in respect to the time share. These costs would be considered fixed costs to an accountant such as this author. The guideline assumes that all costs will increase on a relative basis if the child spends more time at a household and less at the other parent's household.</p> <p>This error is large in that a significant part of the underlying economic costs of raising a child will not vary significantly if there is any amount of shared custody above a token level. The amount of the error is material for most practical levels of custodial relationship where both parents are involved. The sources of the error are found in the components that do not change. The below table summarizes the major components of a child's financial need and provides a hypothetical column of estimated % for illustration purposes.</p> <table border="1" data-bbox="667 1279 1199 1412"> <thead> <tr> <th>Financial Element</th> <th>Variable</th> <th>%</th> </tr> </thead> <tbody> <tr> <td>Food</td> <td>yes</td> <td>18</td> </tr> <tr> <td>Clothing</td> <td>yes</td> <td>14</td> </tr> <tr> <td>Other Personal</td> <td>yes</td> <td>20</td> </tr> </tbody> </table>	Financial Element	Variable	%	Food	yes	18	Clothing	yes	14	Other Personal	yes	20
Financial Element	Variable	%												
Food	yes	18												
Clothing	yes	14												
Other Personal	yes	20

	Commentator	Comments		
		Transportation	partial	17
		Shelter	no	31
3.	California Coalition for Families and Children/CCFC- A Non Profit Organization	<p>The error relates to the components such as shelter, which would not vary very much with different levels of a custody arrangement when both parents are involved. When there are shared custody arrangements involving the typical level 20%-30%, the error tied to the mathematical misapplication is most pronounced. In the ‘non-custodial’ 20% timeshare situation, the NCP would be required to have a room and dedication house resources in order to maintain his/her relationship. Most likely, this would necessitate the expense of paying for a room (have larger home or apartment) for each of his/her children while they are with the NCP. This expense does not go away when the child is with the primary parent. The costs for these fixed costs are the same or similar for the NCP if the child is with him 20%, 30%, or even 80% of the time if the situation was reversed.</p> <p>The formula used in the guideline is flawed in that it assigns a total (assumptive) cost of housing for the parents and allocates the total cost for the fixed housing costs cost relative to the income of the respective parent and then allocates a time share allocation for the NCP to reimburse the Primary custodial parent (CP) for the total cost for the fixed housing costs. This flawed allocation ignores that the NCP is already directly paying “most likely” an assumptive 50% of the total costs for housing and the NCP is also directly paying a similar assumptive amount 50% of the total costs of housing. The component of the child support related to housing would attempt to have the NCP reimbursing the CP for a potion of something he is already paying for himself directly. The amount the NCP would therefore pay for housing for the child in both household is then out of proportion to the relative income he/she has in respect to the CP and error is least pronounced at the needs of the spectrum (0% timeshare and 50% timeshare.).</p> <p>In other areas and highlighted in the report, the K factor is high. We can add that this enhancement was wrongly enhanced with the rationalization it is necessary and acceptable because of the “high cost of living in California.” The factor incorrectly enhances a percentage of income to allocate to child costs. However, this is a misnomer in that the K factor is not needing an adjustment because the average income of California residents is also higher because of the same factor to help compensate for the higher cost of living and the higher nominal dollars needed for child costs are already reflected in the higher average income of California residents.</p> <p>We are respectfully submitting this for review and are available for detail explanation or further investigation for the concepts that are being introduced.</p> <p>Attached is a copy and paste of what was posted on thecpulicccourt.com "comments"</p> <p>Below is the ongoing research findings being conducted while collecting stories from hundreds of many of San</p>

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

Commentator	Comments
Emad Tadros MD and CCFC	<p>Diego Parents who are victimized by the so-called “Family Court Dismantlers”:</p> <p>As long as:</p> <p>A. 50/50 custody “BY DEFAULT” does NOT exist along with child support,</p> <p>B. child support is being based upon parents’ income and not necessarily the child’s actual needs, the money churning machine ripping off families, run by the Court Family Dismantlers, will only have an incentive to keep pushing parents into the ring, fiercely fighting each other longer and harder.</p> <p>HOW?</p> <p>What happens when it is NOT 50/50 physical Custody:</p> <p>1- One scenario, where a lower percentage parent (usually the one who is the cash cow) let us say 30% or so, will ALWAYS be anxiously prompted by his/her attorney to only keep paying the Family Dismantlers for “Hire” to their COURT ORDERED SERVICES to see his/her kids, hoping for higher percentage over time.</p> <p>Once 5% higher Physical custody, i.e. as little as 35% is achieved, the bribing parent (to the dismantlers), obviously will start paying less child support to the other parent! Any such increase (from 5-50%) is highly dependent upon money paid (bribed by that parent) and money still visible to the Family Court Dismantlers to grab. The Dismantlers’ report will be fabricated and filed with the court, accordingly.</p> <p>Imagine such a rich parent paying \$50,000. Would that parent get a 50% increase in Physical Custody?</p> <p>Does anyone know if there is a \$\$\$ Service Menu (fees/bribes) to adjust the physical custody?</p> <p>Would that take us to square one as to why there is never 50/50 custody by default, except for poor parents, where this becomes an almost automatic procedure?</p> <p>2- The parent who has a higher custody of 70% is warned by his/her attorney (who have been keeping quiet since 2001, aiding and abetting CA Court Rule Violations and allowing the dismantlers to commit perjury in day-light). They subtly keep that parent in fear that he/she will have to pay them more fees to keep the support coming at 70% and not any less\$\$\$. That parent also senses the subtle threat coming from the dismantlers for likely less custody,</p>

		<p>so they only keep paying both the attorney and the dismantlers to keep custody at 70% (because there is no such 50/50 by default). This way, the kids’ college funds only continue to churn to the Dismantlers and Attorneys on both sides.</p> <p>3- As a result of such a firm “hollywood-stance” orchestrated by the Dismantlers and attorneys in action on both sides, and successfully tearing apart both parents, the next move is to start accusations, further breaking down both parents!</p> <p>Surely and gradually, both parents while losing their shirts to the Dismantlers and Attorneys, will only find themselves fighting each other for years, to be able to see their kids!</p> <p>What a Racket?</p> <p>Who else gets indirect financial support for this behavior?</p> <p>Why do the judges not legally report election campaign funds?</p> <p>The end result is Mom and Dad are both fighting real good utilizing both attorneys, with the Attorneys giving you the intelligent impression that they are on your side and you are a winner —pay this to get this much percentage higher, pay that to get that, etc. When in fact the Dismantlers including Attorneys, Evaluators, Therapists, and Mediators are ONLY cashing out the kids’ college funds with nothing left for the kids.</p> <p>Wake up parents.....</p> <p>...Parents, please listen to other parents in the know, and do not believe one iota of what you are being told by your attorneys who keep promoting and supporting the Dismantlers.</p>
4.	Child Support Directors Association (CSDA) of California	<p>These comments are submitted by the California Child Support Directors Association (CSDA\). CSDA represents the 51 statutorily created county or regional local child support agencies in California. These agencies employ over 8,000 child support professionals who manage approximately 1.6 million child support cases and serve the interests of over 1.8 million children. Thus, the local child support agencies are uniquely qualified to evaluate and comment upon the review of the child support guidelines.</p> <p>EXECUTIVE SUMMARY</p>

References to individuals’ names and issues not relating to commentary on the child support guidelines have been edited as allegations regarding individual case processing are beyond the scope of this study.

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

	Commentator	Comments
		<p>In 2009 the Legal Practices Committee of the Child Support Directors Association reviewed existing issues concerning the California Child Support Guidelines. Based on the findings of that committee, proposals for modifications of the guidelines were submitted by the Child Support Directors Association to the consultants charged with the review of California's uniform child support guidelines. <i>See summary of this study below:</i> Background: Child Support Directors Association Study of California Child Support Guidelines. Upon receipt of the <i>Invitation to Comment on the 2010 Child Support Guideline Study</i>, CSDA analyzed the findings and recommendations, and makes the following comments thereon:</p> <p><i>Recommendation 1: Update and/or modify the low-income adjustment in the guideline.</i></p> <p>CSDA strongly supports this recommendation. CSDA agrees that the low income threshold should be adjusted to provide the obligor with a subsistence allowance and to lower the percentage of an obligor's income allotted to child support, and that the court should retain the discretion to deviate from the guideline in an appropriate ease. The California Automated Child Support Enforcement System (CSE), which is the statewide data management system used by the California Child Support Program, houses data that can show how orders obtained at a specific income level performs. CSDA will have access to this data for analysis in the near future. A review of this data will be helpful in considering how the guideline should be adjusted for low income obligors.</p> <p><i>Recommendation 2: Evaluate the current income attribution policies.</i></p> <p>CSDA strongly supports this recommendation. In addition, CSDA believes that a revision of the presumed income statute (Family Code section I 7400(d)(2)) is needed as part of the Guideline review, and has made a proposal for such a revision. <i>See Appendix A and attachments.</i></p> <p><i>Recommendation 3: Educate stakeholders and equip them with information so they can make the current system work better. In addition, develop strategies to engage stakeholders and encourage their active participation in the child support process.</i></p> <p>CSDA supports this recommendation and proposes that local child support agencies be included in any and all discussions that are offered to all other stakeholders for purposes of addressing the review of Statewide Uniform Child Support Guidelines and any resulting proposed legislation or outcome. CSDA also proposes that language in this recommendation identify the local child support agencies as a key stakeholder with a voice through the remainder of review process.</p>

References to individuals' names and issues not relating to commentary on the child support guidelines have been edited as allegations regarding individual case processing are beyond the scope of this study.

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

	Commentator	Comments
		<p><i>Recommendation 4: Adopt any necessary conforming changes so that California can meet the 2008 federal medical support rules that are currently in effect, but also recognize that 2010 national health reform may produce changes to the federal rules in the future as well as changes in how states approach medical support.</i></p> <p>CSDA recognizes that much is unknown regarding the changes which the health care reform brings. However, with the passage of SB 580 (Statutes 201 0, chapter 103), the issues of "reasonable cost" and "reasonable access" are adequately handled at this time. CSDA suggests that state and local resources required to develop and implement new or amended statutes regarding medical support now, when changes to the underlying federal rules appear inevitable, could be better spent elsewhere at this time.</p> <p><i>Recommendation 5: Encourage better and more detailed information in the case file.</i></p> <p>CSDA supports this recommendation.</p> <p>See attachment for full text of comment.</p>
5.	CRISPE Marcy Ganz	<p>The child support guideline review fails to consider the manipulation of parenting time with the courts. The courts will award an NCP a 30% timeshare and then in turn state for the child support guideline that the NCP spends 0% timeshare when this is not true based on false claims by the CP.</p> <p>The guideline should promote fairness and both parents should have equal access to both kids equally and this financial abuse that is demeaning to NCPs should be eliminated since it is comparable to racist Jim Crow laws.</p> <p>The current report is biased and racist against NCPs.</p>
6.	Dunbar & Dunbar Donald E. Dunbar Jr. Attorney	<p>I have been in the Family Law business for more than 25 years. The time share percentage provision of the child support often causes money concerns [on both sides] to become more important than the child's welfare and contact with the non-custodial parent. It seems to me that there should be 15% blocks only [15%, 30%, 45%] so that the parents do not try to fight over a day or evening just to drive the support up or down. This would effectively separate the concept of child support from the parenting arrangement and let folks focus on the child's welfare and not on moving a couple of percent on the child support calculation.</p> <p>The other thing is that a one-percent change in timeshare does, not, in reality, translate to a shift in the child's expenses.</p> <p>I hope this information is useful. Thank you for your time.</p>

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

	Commentator	Comments
7.	<p>Fathers and Families Glenn Sacks, MA, Executive Director Michael Robinson, Legislative Representative</p>	<p>Dear Sirs and Madams:</p> <p>Fathers and Families believes that children need to be supported emotionally and financially by both parents after a divorce or separation. We believe that California’s child support guidelines should be reasonable and fair to all involved parties. The new Review of Statewide Uniform Child Support Guideline 2010 (Draft Report) is a step forward in some areas, but also has problems.</p> <p>Fathers and Families has long expressed its concern, both to the AOC and in the media, that the child support system is unfair and at times abusive to low income obligors. To its credit, the 2010 Review does put an emphasis on making reforms to assist low income obligors.</p> <p>As the Review notes, child support obligations for low income obligors are often set too high, in part because the appropriate hardship deductions are not being applied. As a result, many of these individuals scarcely have the resources left to maintain their own residences, and their child Support obligations can lead to homelessness. This is particularly true in today’s depressed economic climate.</p> <p>Another positive is that the Review does not call for any child Support increases.</p> <p>On the other hand, there are some substantial problems with the current Uniform Child Support Guideline which the Review fails to address. These include:</p> <ol style="list-style-type: none"> 1. California’s K Factor, which requires a child support obligor to pay 25% of his or her after tax income for one child, 40% for two and 50% for three, is one of the highest in the United States. The of-stated justification for this is that California’s cost of living is high. However, since the Guideline is based on percentages of income, the cost of living is irrelevant. The K factor should be lowered, particularly in the current economy. 2. The K factor only applies up to a combined income of \$6,600 a month—above that it goes to the H Factor, which is 10% higher until a combined income of \$10,000, in which case it is 12% higher. This is hardly fair to these child support obligors, many of whom have worked long and hard to become good providers for their families, and are now <i>de facto</i> punished for their efforts and their success.

		<p>Yes, in a perfect world, children of divorce of separation would maintain the same standard of living after the breakup as before. In the actual world, when the same income(s) which supported one household must now support two, living standards are inevitably going to decline.</p> <p>3. The Uniform Child Support Guideline should be based on the needs of the children involved and should be related to the actual cost of raising a child. The Review glosses over this important issue.</p> <p>Fathers and Families is a national 501(c)3 not-for-profit charitable organization with offices in Sacramento, Los Angeles, and Boston. Fathers and Families improves the lives of children and strengthened s society by protecting the child’s right to the love and care of both parents after separation or divorce. We seek better lives for children through family court reform that establishes equal rights and responsibilities for fathers and mothers.</p> <p>Thank you in advance for considering our comments.</p>
8.	Candace Goldman Family Law Facilitator Superior Court of Alameda County	<p>Overall, the direction the proposals seem to be headed is good. I would especially emphasize the following:</p> <p>1. The LIA needs to be raised; using the either the minimum wage (state rate if higher than federal) or an income figure at a % rate over the region's poverty level could work. Using a more flexible formula would allow automatically for the changes without having to pass legislation repeatedly.</p> <p>2. For low and moderate income parents, both the base % of income attributable for child supports AND the levels of income attached to that percentage need to be modified downward. Using 25% for the income range of \$800 - 6K is too broad. Needs to start with a lower % and work upwards in smaller income increments. It is important to remember the studies that show child support arrears for lower income people become significant when child support order amounts exceed 20%. So why do we start support rates at a higher percentage - this seems self-defeating.</p> <p>3. We are moving toward having the jurisdictional locus be with the obligor when there are multiple cases involving one individual. This is a step in the right direction, so all of the support adjustments can be made for that individual in one setting rather than requiring multiple hearing locations and potential continuing conflicting and unrealistic - and effectively unenforceable - orders. It would be good to eventually coordinate support cases between multiple obligors with the same obligee also.</p> <p>4. I think the general provision for a \$50.00 minimum support order is workable in most cases, but of course the</p>

	Commentator	Comments
		<p>judicial officers should continue to have discretion to reduce it for LIA and other appropriate factors, or to reserve support pending further developments.</p> <p>5. Health insurance and child care costs need to be more integrated as part of support - the current formulas and allocations often result in untenable orders for obligors, rendering their ability to maintain self-support difficult to impossible. These should not be straight add-ons, and insurance should be prorated, per the recommendations.</p> <p>6. Health insurance - more flexibility for additional coverage at the lower income spectrum with more use of a Medicaid premium share and establishing a cash med. support system for those carriers that use the fee-for-service; I think this could be worked out without having the "overpayment" problem. Maybe something similar to a flex/med. spending account that the obligor makes deposits into for Medicaid to draw from?</p> <p>7. Child care - again, integrate more into the total calculation. We can prorate it now, which helps, but it still often results in tipping the obligor too far into the red, again creating both a disincentive to pay and a disincentive to work.</p> <p>8. The situations we are presented with are always those where there is NOT an intact traditional family, so we can't really use that situation to guide us for establishing baselines for child support. Two households simply do not function as economically as one (duh.) This means, for instance, that we may need to start taking rent into account - or set a statewide average to use as part of the support calculation. It would have been good to see more statistical information directly related to the fact of two household economics in the survey.</p> <p>The tension between supporting children both at an acceptable minimum and to the standard of living of the parents is difficult to maintain. We don't want children to suffer, economically or in having a relationship with their parents; but if we push too hard against an obligor, or don't require enough from an obligee, we create tensions both between the parents and with the legal system, so that we wind up with children who are caught in the middle, parents who feel they are not being fairly heard or served, and a system that see-saws between punishment and reward. I hope that the ultimate provisions that are adopted from this review will establish a more even-handed support model that will hold everyone - parents, children, and the judiciary, in good stead.</p> <p>General Comment: Thanks to the group that did the study and developed the recommendations. This was obviously an intensive review. It confirmed what those of us in the trenches have actually been aware of for some time. I look forward to seeing the results.</p>

		Thank you again.
9.	Randy Hoff President ODHC	<p>In California there is little doubt that current child support guidelines are doing more harm than good for children of broken families. One of the primary issues plaguing the system occurs when unreasonable court orders for child support are placed upon non-custodial parents (NCP's) who have little or no income.</p> <p>Therefore, we must explore the causes of the NCP's inability to pay child support and amend the Uniform Child Support Guidelines in a manner that produces successful outcomes in cases of limited income or no income at all. Many scholars attribute higher earnings to higher education, and many peer reviewed studies have been conducted over the years which strengthen such a statement. In fact, when a non-custodial parent has no high school diploma or college degree to present to a prospective employer, they are unlikely to get a job and their earnings potential is drastically diminished. The resulting difficulty of the undereducated NCP's ability to find gainful employment generally results in the NCP's inability to pay child support as ordered--based on California's current child support guidelines. This issue also begs the question as to why there are no educational advantages, benefits or opportunities in place as incentives for NCP's who are struggling to increase their earning power via higher education. If there were educational opportunities, or at the very least, a class-time forbearance or deferment of</p>

	<p>payments established in the child support guidelines, NCP's would be better positioned to afford child support payments as a result of their expanded education.</p> <p>In California, more women attend and graduate college than do their male counterparts, some feminist groups may claim females are simply "smarter" than males but we found that financial health was the more likely cause of this disparity. According to twenty-five college students interviewed at the California State University of Sacramento, the primary reason for failing college or being unable to attend college was financial distress, such as, the inability to pay for it. Financial health and ones chances of attending college have a correlation and can be studied further to show the latter a causation of the first. In 2009, the aforementioned gender disparity in post secondary education was a high 57% females to a mere 43% of males attending college: This issue has reached a peak since the 2004 Report by the California Post Secondary Education Commission, which can be viewed here: http://www.cpec.ca.gov/completereports/2006reports/06-08.pdf .</p> <p>This dangerous disparity poses serious socioeconomic ramifications and further exacerbates the problem of male NCP's who demonstrate an inability to pay child support. Especially NCP's with limited or no income and those who have few prospects of gainful employment due to their lack of job qualifications. If California is ever to get child support arrears under-control, this massive reverse gender disparity in higher education simply can no longer be overlooked.</p> <p>Since most child support paying NCP's are male (~80 %+) it can be reasoned that some of these males would otherwise attend college if their financial circumstances improved just enough for them to succeed--such as reduced or deferred child support payments. If the majority of NCP's (males) were able to attain a valuable (life changing) degree or technical certificate from an institution of higher learning, California is very likely to see an increase in child support payments being paid on time. For example, in the cases of NCP's who can barely pay child support, it seems that court ordered child support payments could very well be standing in the way of their ability to pay for tuition, books and basic necessities, therefore, leaving the hopeful NCP student with few options and a continued inability to make child support payments. The cycle of non-payment can continue for years and years--something must be done.</p> <p>A fine analogy would be that teaching a man to fish is far better for our society than merely fishing for him and simply handing him the fish.</p> <p>Since females are generally the receivers of child support payments in ~80% of cases, it could be reasoned that some women who are attending college use the "excess" cash deposited for child support payments for improving</p>

	Commentator	Comments
		<p>their education and employment prospects. There is simply nothing wrong with doing everything for females' education, unless it causes the problem we currently have, which is excessive numbers of uneducated or undereducated males who are unable to find a job and unable pay child support as a result. A reduction of child support paid to Custodial Parents while a NCP is attending college or attempting to attain a GED or enrolled in a technical school would undoubtedly benefit both the NCP and the CP and more importantly the children in the long run--for the majority of cases. Child support was never meant to serve as the custodial parent's ticket to pay for college. It should be allowed only for sending the children who it is owed to college. The fact is, Child support payments are being used for everything from tuition to drug use. To rectify this problem and get this money back to the children means that all excess cash remaining from child support payments--not spent directly on the rearing of a child/ren-- must be returned to NCP's at the end of each month or deposited into a savings account for the child/rens college education. To allow child support to be spent on things other than what it was intended to be spent on, namely the children, is not in the child/ren's best interest.</p> <p>The single most effective solution for parents who abuse child support payments or fail to "share" state funded food benefits that are intended to be used for buying child/ren food, is to provide two electronic debt cards one (1) to each parent or guardian. Then electronically set limits in the form of percentages that can be spent in accordance with actual time spent with the child/ren. For example, an EBT food card should be set to allow a parent to spend no more than 25% of the total monthly balance for NCP's who are awarded 25% custody. Conversely, CP's who are awarded the remaining percentage (75% in this example) should only be allowed to spend 75% of the total food benefits available on the card in any given month. This will shore up many disparities in the large food expenses associated with rearing children. A 50-50 share parenting schedule should have a 50-50 EBT debit allowance per parent. The same system should also be implemented for all cash child support payments. In doing so, both parents would maintain a sense of financial control over their child/rens welfare. But more importantly, drugs and alcoholic beverage purchases, with "child" support funds, would be a thing of the past.</p> <p>California's courts need to be empowered through the Uniform Child Support Guidelines to encourage CP's to spend child support money directly on the child/ren for whom it was intended or face civil action from NCP's for monetary damages to the children and their future financial welfare. Allowing child support to be spent on things like drugs and alcohol is a crime against the children of California's broken homes-period! The courts and NCP's should both be fully empowered by law to place all Child support payments for use through an electronic debit card similar to the current food stamp EBT card issued by HHS. By doing so will reduce abusive spending and the robbing of California's children, a perk that drug and alcohol addicted CP's have enjoyed for far too long. Child support is intended for children not the parents--this fact has been distorted and must be reaffirmed. California lawmakers must reiterate that "Child Support" is for the "Child" in legal terms through an amendment to the</p>

		<p>Uniform child support guidelines.</p> <p>On a more disturbing note, male NCP's who have no opportunities available to them (or feel as though they have none) have a greater propensity to wind up in the criminal court system. It must also be noted that domestic violence against custodial parents is the leading cause of arrest of NCP's during custody negotiations. Domestic violence often occurs more commonly when child support payments are not paid-- very unwelcome social side effects. Therefore, assisting NCP's on a new path toward success may actually reduce the number of new domestic violence cases that present and evolve during child support/custody battles. In addition, helping NCP's achieve their educational goals by reducing, forgiving or deferring child support payments during an NCP's educational progress is a winning proposition for the children of California's broken homes.</p> <p>NCP males who have court ordered child support payments are unlikely to attend college due to the excessive financial demands placed on them by the courts. As previously mentioned, many female CP's rely on child support payments to meet their educational goals, conversely, many male NCP's are unable to attend college due to overburdening child support payments and past due arrears-- causing legal issues (including criminal actions) as a result thereof. Federal Financial aid programs are unavailable to males who have not registered for the draft (Selective Service) or who have certain criminal convictions-- FTA's due to non-payment of child support arrests have lead to many felony convictions which may disqualify male NCP's from Federal help for school. Arresting NCP's is clearly the wrong approach to helping California's children-- and violates the Bill of Rights. As a result heretofore, studies (which include child support cases) must conduct to determine the leading cause of this detrimental disparity in number of females vs males currently attending college. The aforementioned disparity should be under serious scrutiny by enforcers of Title IX of 1972. Until then, child support guidelines should reflect this profound educational disparity and make adjustments to the child support guidelines which allow some minor relief to indigent male NCP's who are trying diligently to get their G.E.D. or attend college or technical schools.</p> <p>Another subtle financial disparity can be found lurking in California's Health and Human services departments. Female NCP's and CP's alike (not males NCP's or male CP's) have been specifically targeted for increased benefits though single-gender Health and Human Services eligibility standards. As a result, females can (and do) receive numerous government sponsored child care programs, housing stipends, grants and food programs that are not made available to their NCP male counterparts-or are weak at best. These programs are a valuable resource for females who are "stuck" in a downward cycle but they do little to help male NCP's or CP's get back on their feet. HHS fails to deliver services to needy male NCP's time and time again- a gas voucher from HHS for male NCP's to get to work is not available nor an offered service. The California HHS model must be corrected to create the lowest gender imbalance possible when any NCP enters a Human Services Department seeking financial assistance.</p>

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

Commentator	Comments
	<p>HHS Department heads must take drastic measures to prevent the current discrimination from continuing when providing services for indigent NCP's. Until then, the Uniform child support guidelines and child support payments must reflect the thousands of dollars in benefits that male NCP's are ineligible to receive but female CP's and NCP's are eligible to receive. The California HHS is required by law to assist any person equally regardless of gender; however, the HHS sets their eligibility criteria to meet the likes of only one gender, namely females. For example, the acronym WIC stands for "Women, Infants and Children." This program is described on this website: http://www.fns.usda.gov/wic/</p> <p>"WIC provides Federal grants to States for supplemental foods, health care referrals, and nutrition education for low-income pregnant, breastfeeding, and non-breastfeeding postpartum women, and to infants and children up to age five who are found to be at nutritional risk."</p> <p>The WIC program is a wonderful program, for women. Yet, when a male CP or NCP who has full or partial custody of a child of age two to five years old (non-breastfeeding) asks for WIC benefits, he will generally be confronted regarding the whereabouts of the mother. Shortly, thereafter, he and the child will more than likely be declined services until the mother presents herself. Similar forms of this overt sex discrimination in HHS has led to state taxpayer funded "Women's Shelters" being sued for refusing services to males. Here is a related article from October 2008. It can be read by visiting this website: http://articles.sfgate.com/2008-10-16/bay-area/17135746_1_domestic-violence-appeals-court-violence-laws . Until both genders can be equally assisted by HHS with state funds, the Uniform Child support guidelines must be altered to reflect the lack of benefits paid to indigent men who have children in their custody either full-time or part-time. The disparity in benefit eligibility and benefits paid out to females vs. males in California is a whopping \$200 in benefits paid to females for every \$1 paid to males. This equate to hundreds of millions of dollars annually and has far reaching financial impacts on male NCP's vs their female NCP's counterparts.</p> <p>NCP's who are trying diligently to get back on their feet to support their children and pay their child support may also need help buying food for a child--this is a two way street. Not only do females have trouble affording food for children, Non-Custodial parents also have similar trouble affording food for their children during their scheduled parenting time. All expenses must be accounted for when awarding any cash claim for child support--regardless of who has the child/ren for the most time during the week or month. Receipts should be presented and shall be accepted by the courts as child rearing expenses regardless of who the CP or NCP is.</p> <p>These two questions have now arisen: Should indigent NCP's be forced to have their children go hungry while custodial parents collect food stamps, stipends, gas vouchers, subsistence checks and WIC? Should NCP's be</p>

Commentator	Comments
	<p>placed in a position to beg a Custodial Parent for food when the children get hungry during the NCP's parenting time? I don't think so, and these extra expenses placed upon indigent NCP's--when the NCP's can afford them--should be considered in full when making a decision regarding how much a claim for child support should be awarded or what payments will be used for what purposes. The court should also have the discretion of awarding some of the food stamps, stipends, subsistence or cash to any indigent NCP who is turned down or denied benefits from a state funded HHS Department. The power to parent is not for lawmakers to manipulate but the power as to how one spends a child's food money is.</p> <p>On a lighter note, California should be more progressive and offer similar programs like WIC but instead call them "MIC" for Men, Infants and Children. These programs should be implemented for males who have full or partial custody of infants and biological or adopted children under age five years old. Sometimes Custodial parents "Hoard" what the state has provided to them in the form of food or food stamps. Not providing food services to both parents, regardless of whom the CP or NCP is, leaves the child without food when the CP refuses to give some of the subsidized food to the NCP--this almost always leads to an argument between CP and NCP's. By splitting food stamp services proportional to individual parental time spent with a child/ren will ensure that altercations (domestic violence) do not erupt when a NCP asks a CP if they can have some food stamps or food to feed the children. Especially while the children are with an indigent NCP during normally scheduled parenting time. Until then, the Uniform Child Support Guidelines must take into account the massive costs of buying groceries for children in this age range and deduct any grocery purchases made for the children from any court ordered child support. NCP's expenses are rarely state sponsored or subsidized and are outrageously high. These NCP's expenses must be accounted for when setting child support guidelines. NCP's or CP's who are not entitled to the millions of dollars in HHS benefits that are available to CP's should be compensated via lowered or forgiven child support payments when child support guidelines are being considered.</p> <p>Here is an off-topic and less significant proposal, yet a very serious factor in male NCP's inability to pay child support. It lies in discriminatory Automobile insurance practices and their related premiums. This factor must also be taken into account when calculating child support and establishing guidelines. There is a massive disparity in payment amounts made by males vs. females to insurance companies (All). All California males pay on average of \$800.00 more per year for full coverage Auto insurance than do their similarly situated female counterparts (Geico & Farmers). This may not seem like a substantial figure unless one considers the financially challenged college student who must choose between paying for car insurance, paying for college tuition or making a child support payment. In 2010, \$800 is roughly the cost of one and a half semesters worth of college textbooks. That means males, over the course of five years of college, pay over \$4000 more in car insurance premiums than do females. These payments made to insurance companies are compulsory in nature, since failure to maintain valid auto-</p>

	Commentator	Comments
		<p>insurance coverage can lead to arrest and fines totaling over \$800 + -- among other penalties. This overt business practice discrimination should be corrected through a Bill introduced in the California Legislature. Until then, the California's Uniform Child Support Guidelines must take these additional expenses that male NCP's vs. female NCP's are required to pay by law.</p> <p>With that said, we can now propose two primary changes to California's Uniform Child Support Guidelines that will impact and likely rectify many of these disparities once and for all.</p> <p>The way to correct the aforementioned gender disparity in higher education is to provide a full deferment of child support payments, without interest, during any period a Non-custodial parent (NCP) is attending an accredited institution of higher education. Furthermore, when a NCP does not currently have a high school diploma and they are attempting to attain a G.E.D., then child support payments must be waived, reduced or forgiven at the rate of 100% while the undereducated NCP is attending classes, with the exception that the actions taken by the NCP will directly lead to the NCP receiving her or his G.E.D. In addition, Pamphlets should be provided and posted for these services and deferments at all points of contact with Child Support agencies statewide--including but not limited to direct mailings.</p> <p>If properly implemented, these two changes will lead to a short term social reform that will undoubtedly have positive long term effects on NCP's ability to pay court ordered child support, as well as being in the best interest of the children of broken homes. The state of California has a large arrears balance and these two changes to the California Child Support Guidelines will get the NCP's educated and into the work force. The self esteem of NCP's will be improved significantly reducing governmental dependence, preventing new domestic violence cases, lowering the overall statewide arrears (more child support paid) and provide an increase in healthier child/parent contact--and ultimately, leading to a society that can be proud of its accomplishments.</p> <p>PLUS: This is a good idea--that is why the child support guidelines should be altered to reflect this powerful tool in setting indigent NCP's on the road to educational success--not continued failure.</p> <p>ADDITIONAL PROPOSALS:</p> <p>Alter the Uniform Child Support Guidelines to reflect the major expenses of having a child for only a few days out of the week.</p> <p>In cases of 25% or more parenting time, the NCP'S expenses nearly equal those spent by custodial parents who have a child for less than or equal to 75% of the time. Expenses such as electric bills for the "other" home, water</p>

	Commentator	Comments
		<p>bills for the "other" home and the expenses of having unused food go bad etc. These additional expenses (among hundreds more) must be taken into account when calculating child support. The sum of these additional expenses are large enough that many NCP's are left with little food for themselves and no gas money to get to work.</p> <p>As mentioned throughout, please establish the child support debit card system to prevent abuse of funds that are specifically designed to support children; namely, prevent the purchases of drugs and alcoholic beverages. Provide a card for both NCP's and CP's to ensure both parent have access to child support funds-regardless of who has been awarded child support payments. Set percentages of card use directly proportional to amount of custody awarded. A NCP with a 0% custody award would also have a zero dollar card spending balance. While the other parent would have a 100% spending balance. A 50-50 shared parenting agreement should also maintain a 50-50 card spending balance-regardless of who pays for the funds to be placed on the card. This system would be in the best interest of the children because it will allow the courts to gauge and accurately balance the funds from one parent to another parent; therefore, continuously maximizing the all funds available for the child/ren, while simultaneously preventing the abuse of the child/rens funds.</p> <p>It's well past we make the system fair for everyone involved, as it is right now, the social trauma endured by non-custodial parents and their children will last a lifetime. We must make these changes for the children who are caught in the middle of an unfair system. God Bless the Children of California's Broken Homes.</p>
10.	Litigants For Justice Janette M. Isaacs Civil Rights Activist	<p>In Re Recommendation 2: Evaluate the current income attribution policies:</p> <p>I recommend that you consider modifying the presumption that imputation shall not be based solely on a Vocational Examiner's testimony.</p> <p>Imputation should be based on actual money earned by the obligor vs. unearned speculative income that the court orders the obligor to pay.</p> <p>Imputed income must be substantiated by actual historical vs. hypothetical and/or speculative numbers (based on W2's and or tax returns). Proof of earnings should not be based on the speculative scenario of one biased vocational examiner hired to influence the court in one litigant's favor for imputation purposes.</p> <p>Actual and historical income based on pay stubs, tax returns or W2's filed within the past one to five years should take precedence over a hypothetical what if earnings scenario.</p> <p>In my case for instance, ... I was imputed to pay \$1,223.00 retroactively in child support (per month) based on a</p>

	Commentator	Comments
		<p>hypothetical earnings scenario.</p> <p>I have still not been able to earn the amount I was imputed to pay based on this "what if I had been paid" hypothetical earnings scenario. In closing, imputed income must be based on actual vs. hypothetical earning scenarios.</p>
11.	Matthew M. Kremer, CFLS	<p>I would comment as to the second recommendation, as follows:</p> <p>While case law, such as <i>Regnery</i> and its progeny, are useful in giving us benchmark tests for imputing income, more recent decisions (<i>In re Marriage of Bardzik</i> (2008) 165 Cal.App.4th 1291) go on to put the burden of proof on the party seeking to impute income to the other. It seems to me that the burden should be on the non- or under-performing parent to show that income should not be imputed to him/her and if (s)he meets that burden it would then shift to the other party</p>
12.	Superior Court of Los Angeles County Janet Garcia, Court Manager Planning and Research Unit	<p>Agree with the recommendations- The Guideline study involved a random sample of 1,226 child support orders entered in 2008 in 11 counties (split between very large, large, medium and small counties). The sample included almost equal shares of IV-D and non-IV-D cases.</p> <ul style="list-style-type: none"> - The 2010 study found guideline deviations in 15 percent of the cases reviewed. This deviation rate is higher than that of previous years' studies (1998, 2001 and 2005) which ranged from 9 to 10 percent. The commissioners surveyed for this study acknowledged that they deviated in cases where the obligor has very low income and payment of the guideline amount would impoverish the obligor. - In ordering support, California does not consider how much income the obligor needs to live at a subsistence level. California uses only a percentage reduction to the regular guideline amount, and then, only for obligors with \$1,000 net income per month or less. - By contrast, most states have a "self-support reserve" as the underlying basis for the support order in low income cases. This reserve is linked to the federal poverty level for one person and the resulting support order in these states is the amount the obligor earns above the federal poverty level. - Additionally, California's income presumption policy makes the guideline problems worse for low income parents. In IV-D cases where the local agency is establishing the support order and the obligor's income history and income is not known, income is presumed at minimum wage for 40 hours per week. Almost all other states have policies that consider the current job market or presume fewer work hours.

	Commentator	Comments
		<p>- One of the recommendations is that the low-income adjustment be revised to more accurately reflect the financial circumstances of low income obligors. A second recommendation is that the current income attribution policies be revisited.</p> <p>- The percentage of orders entered through default, 46 percent, is back up. Commissioners believe that many defaulted orders are ones in which DCSS requested a relatively low order that the obligor did not contest. Advocates believe that it is due to the economic recession and the unaffordability of attorney representation.</p> <p>- Regardless of the reason for an increase in the default rate, one of the recommendations is to increase access, understanding and involvement by parents. For the most part, better educated parents have higher compliance rates and are more involved with their children.</p>
13.	Donna L. Mallen Attorney	<p>I concur with conclusion 21 as to the devastating impact on children that is engendered by the use of percent of custodial timeshare as a Guideline factor. I have been in practice as a Family Law Specialist before and after the Guidelines went into effect. I have seen high-conflict custody battles, motivated by a parent's desire to reduce or increase child support, become commonplace and predictable, since the Guidelines went into effect. This is toxic to children.</p> <p>The proposal to use "block times" of custody percentage (on Page 116, in the Focus Group results), or alternate approaches, such as the "percentage of income" utilized in other states, should be incorporated into the recommendations as a possible modification to the Guideline formula.</p>
14.	Partnership for Responsible Parenting Ron Cuff Commander	<p>The advocates who attended our meeting in San Francisco were unanimous on two points:</p> <p>1.) The guideline is too complex for the average parent to anticipate their obligation</p> <p>2.) The guideline should rely primarily on the actual cost to raise a child and minimize conversation or argument about parent's income.</p>
15.	Superior Court of San Diego County Michael L. Roddy Court Executive Officer	<p>Agree with recommendations in the study.</p>
16.	Albert Schafer LCSW Serco-NA	<p>Current guidelines result in chronic misuse of the system resulting in harsh, unjustified, and fatal consequences to the noncustodial parent. There is now a pattern of suicide resulting from the abusive nature of the applying child support guidelines. Because the Courts do not impose any sanctions on false allegations, they are professional contributing to the suicides of an increasing number of noncustodial parents. This also contributes to the increase of suicides in our military. As a suicide prevention coordinator for the Navy Reserves I'm greatly concerned by the</p>

		<p>blind eye of the courts in this matter. It is never in the best interest of children or other family members when someone commits suicide. The current child support guidelines will dig deeper into the pocket than is necessary and then cut off the individuals ability to provide any support by revoking the professional licenses that are instrumental in providing income. The notification standards for Show of Cause are detrimental to social justice and common sense. Mailing a notice without insuring the individual received the notice not only results in increased ability to collect welfare reimbursement but also punishes innocent citizens who are now obligated to pay child support for children who are not theirs and the detriment of their own children and families. Most vulnerable to this practice are the Citizen Warriors who are defending our nation in Iraq and Afghanistan. My job is to provide a safety net to help these families who are at high risk due to the stressors of our society. Combat is where we inflict more stress on our enemy than our enemy can inflict on us; therefore our ability to manage stress is as critical as our ability to control bleeding in the field. As long as the stick approach is used, society will not benefit from the hard handed approach that is currently being used.</p> <p>The courts need to be educated on the consequences of their actions. It does not matter if there are plenty of laws to protect if they are ignored because the courts blindly believe what they are doing are right.</p>
17.	Jim Untersshine Ground Zero Services	<p>The Family Law Uncertainty Principal in California</p> <p>What kind of Tijuana is this? http://www.gndzerosrv.com/Web%20Pages/fl_uncertainty.htm</p> <p>“In the sharp formulation of the law of causality - ‘if we know the present exactly, we can calculate the future’ – it is not the conclusion that is wrong but the premise.” (Heisenberg, in uncertainty principle paper, 1927)</p> <p>There is a distinction between a guideline and a rule, a process and a racket, or a system and a railroad. When it comes to social policy, there must be a thorough understanding of the dynamics of a problem before a solution can be intelligently proposed. Social policy that is implemented based on an erroneous premise may not only result in ineffectiveness – it may just start a revolution.</p> <p>The U.S. Office of Child Support Enforcement (OCSE) reported child support arrearages of \$84 billion across all states in 2000. The State of California leads the nation reporting arrearages of \$15.8 billion, with Texas (\$7.9 billion) and Michigan (\$6.3 billion) trailing the national leader in ineffectiveness by less than half. The ineptitude of the CSE agency operating in California has been the focus of much consternation by those attempting to balance the State’s budget every year.</p>

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

	Commentator	Comments
		<p>* 2000 - Federal law (USC 42 658a) is enacted by Congress, which specifies the state incentive calculations (USC 42 658 repealed). The new method allows States to double the collections that must be distributed last, which includes TANF, Foster Care, and ‘support obligations not required to be assigned’.</p> <p>* 2000 - Policy Studies Inc (PSI) is paid by California taxpayers to conduct the “California Child Support Guideline Review 2001”. PSI recommends no changes to the State’s child support awards and recommends: “the results from the Urban Institute’s study on child support debt be considered when released. It may provide further insights on the ability to pay in these presumed income cases.”</p> <p>* 2001 - Policy Studies Inc is paid by California taxpayers to investigate the State’s CSE accounting with the outcome reported by the LA Times: "Glowing report comes on the two-year anniversary of the state agency that collects court-ordered payments, whose amounts doubled on average per case".</p> <p>* 2003 - The Urban Institute (UI) is paid by California taxpayers to conduct the “Collectability Study” entitled “Examining Child Support Arrears in California”. UI recommends: ‘California should consider the interest charges on unpaid child support. We estimate that 27% of California’s child support arrears, or \$3.9 billion, was interest in 2000’ and ‘as far as we know, there is no priori reason for charging interest before principal. We estimate that if California reversed this order, it would reduce its arrears balance by 6% over a 10 year period’.</p> <p>* 2005 - Policy Studies Inc is paid by California taxpayers to conduct the “California Child Support Guideline Review 2005”. PSI acknowledged the UI perspective: ‘The Collectability Study identified the following three reasons for arrears growth during the 1990s: (1) support order amounts that were too high for low-income obligors, (2) incomplete enforcement, and (3) assessment of interest on arrears.’ PSI recommends, however: ‘No abundance of compelling evidence suggests that the basic guideline formula needs to be changed.’</p> <p>Federal law specifies how collections by state CSE agencies must be distributed (USC 42 657) and demands that child support principal that accrued while not receiving TANF must be paid to the custodial parent first. The ‘piori reason for charging interest before principal’ (that seemed to allude UI) is the same reason that compelled Gray Davis to veto paternity fraud legislation – California seeks to maximize Federal funding regardless of the collateral damage incurred on the parents and the children who are forced to be victimized by the State’s lawless ‘money machine’.</p> <p>“I believe that the existence of the classical ‘path’ can be pregnantly formulated as follows: The ‘path’ comes into existence only when we observe it. “ (Heisenberg, in uncertainty principle paper, 1927)</p>

	Commentator	Comments
		<p>California has chosen to use ‘the path less traveled’ (compared to the law abiding States) by driving parents attempting to support their children to unemployment, which forces the custodial parent and their children to TANF, which allows CSE to keep the debt growing by discouraging payment, which will allow ‘welfare to work’ to help leave the children home alone, which will allow Foster Care to herd the children to same-sex households, which will allow the financially stable Foster parents to take a \$10,000 per year tax deduction for each child (or even more if they request siblings). Although the parent who is originally targeted for collection will be forced to foot the bill for all aspects of their family’s destruction - the practice of distributing interest first, results in the taxpayers rarely seeing a penny of reimbursement, and the targeted parent from slowing the growth of the debt.</p> <p>At least when a Tijuana cop pulls you over while driving in Mexico, he will only take your drivers license, or your car, or put you in jail if you refuse to give him all your money. In California they will also take your kids, your house, and your business, to allow them to rip off their Country’s taxpayers.</p>
18.	Hon Rebecca Wightman Child Support Commissioner Superior Court of San Francisco County	<p>Conclusion 6: As a Commissioner, I would also state that there is another reason for the trends noted: "lack of good information" (i.e. work-related child care is often not included if there is insufficient information; same for issues regarding hardships)</p> <p>Conclusion 10: I do not know if the full study showed a breakdown on this issue of missing information between IV-D and non IV-D cases, but if it did not, it should. In my experience, there is an even greater percentage of missing information in non IV-D cases, particularly on the item of not specifying guideline. This conclusion, in my view, points to the need to require that a calculation be attached to every order (at least in the IV-D departments).</p> <p>Conclusions 13 and 14: I cannot agree with these conclusions enough - particularly that the LIA (low-income adjustment) is inadequate!</p> <p>Recommendation 1: I would suggest that the concept of a self-support reserve amount (basic minimum living expenses) be considered, perhaps tying it into a percentage of the poverty level. Given the inadequacy of the low-income adjustment, I spend quite a bit of time during hearings doing analyses to determine if an obligor qualifies for an off-guideline (on the basis/legal concept of the City & County of San Francisco v. Miller (1996) 49 CA4th 866 case. It is imperative that the amount of child support imposed not be so high that the obligor will not be able to meet their minimum basic needs to live.</p> <p>Recommendation 2: I agree and would suggest that while there needs to be uniformity, there also needs to be some flexibility (i.e. income imputation needs to be consistent with the reality of the economic region - e.g. seasonal farm</p>

	Commentator	Comments
		<p>workers and opportunities in Tulare County are not the same as they are in Marin County or LA).</p> <p>Recommendation 3: In addition to educating stakeholders, it would be helpful to also develop strategies for educating the parents at an early stage, which are built into BOTH the stakeholders' and the child support agency's processes. For example, in SF, through the EPIC project (designed to reduce defaults and get early parent participation), caseworkers are trained on how to assist parents with filling out an answer and/or if obtaining a stipulation, then making sure they understand the need to file a motion if their circumstances change. It should be a part of the process at every place where that family interacts -- including the Title IV-A side. There is a complete disconnect between the IV-A and IV-D and the workers understanding what happens on the other side.</p> <p>Recommendation 5: I actually believe this recommendation should be modified to REQUIRE more information in the case file. Many times, when faced with a modification of child support, it helps to know what the factors were that led to the pending order, so that the court can determine whether there has been a substantial change. It is also extremely helpful to see a prior calculation -- which can show, at a glance, what the court's prior findings were on a number of issues, including timeshare, number of hardships granted, etc. It would help tremendously -- and the court wouldn't have to re-invent the wheel and take testimony all over again where the parties are saying that the visitation hasn't changed since the last time. In those instances, the court can simply utilize the timeshare used at the last hearing -- if they can find it! Having the calculations attached to prior orders, with all the attendant information, helps reduce parties from providing inconsistent historical information to the court as well.</p> <p>I do sincerely hope that perhaps there will be another chance to make comments, provide input on these important topics. Thank you.</p>
19.	Kevin M. Young National Coalition For Men	<p>I attended the Southern California advocates meeting and am appalled with the lack of integrity the group running the meeting. They did not reflect our position at all. It reminded me of typical politics. We will have a meeting, listen to what they have to say, and then we are going to do what we want regardless of what the advocates brought up.</p> <p>The Divorce Industry has beaten us all down to the point where 99% of the people affected by this Industry have given up. Of course there is 1% of us that will seek change in this Industry and to really think about the children.</p> <p>The advocates wanted the Guidelines to be based on REAL cost, NOT income of the parents. When you take a family that is splitting apart who were surviving on a set income then you have to create TWO households, why in the world would you take income from one parent and give it to the other. It makes no sense. I know, I and my children are a victim of this system. In some ways their mother has been negatively impacted by this system as</p>

		<p>well and she was the one receiving money based on this system.</p> <p>We need economic specialist to look at this problem and make a fair and equitable program that will work. We had Prof. William S. Comanor from UCLA attend the meeting and he told the Guideline team that what we have in place is not working.</p> <p>Think about it, if you had something that really worked, you would not be spending so much money trying to collect the outrageous Child Support sums. The Feds need to discontinue the subsidy of this system and maybe the system would run more efficient and fair to all involved.</p> <p>Please take a look at what we actually said. It was recorded and filmed. I wonder if we will be able to get that material. Next time we will have an independent party at the table recording the event.</p> <p>We need a major overhaul of the Guidelines. The status quo is just another indication that the Divorce Industry will continue to take our money and live it up at our expense.</p>
20.	Member of the Public	<p>Child support levels are notoriously high for lower-income individuals. Where is the consideration of the actual typical expenses for raising a child for people at various income levels.</p> <p>Child welfare would probably be improved by avoiding the consequence of non-custodial parents ending up attempting to avoid the authorities because of levels that mis-match their capacity.</p> <p>Where is the consideration of the fact that most non-compliant parents are low income, unemployed, injured, or sick?</p> <p>Where is a means for less-educated and poor non-custodial parents to get the level of child support to change with their sometimes quickly changing employment status and income? Too many people end up in deep trouble, homeless, or suiciding because of the lack of realism and responsiveness in the system.</p> <p>Why were the efforts to solicit public comment so feeble?</p>
21.	Member of the Public	<p>Child support amount paid should be calculated by person's income AND expenses monthly, as well as family size and family obligations. A person's overtime is not consistent and therefore should NOT be included when calculating the amount paid/due. Child support should also be dated on the court date when it is set, not by when an angry ex spouse files the claim and makes the other person past due on payments! Also, a teenager should have to see both parents on a consistent basis, not when he/she decides to, they are not adults until they are 18!</p>

	Commentator	Comments
22.	Member of the Public	<p>A system of determining child support that is based solely on income of parents and timeshare is completely inadequate and unfair.</p> <p>In all other areas of law (civil, criminal, etc.) individuals are held accountable for their choices and/or actions, and rightly so. Not so with family law. The laws as they apply to child custody and child support should also take into consideration the details, like "why are the children being put in a position where child support is necessary?" and "Who is responsible for putting them into that position?" "Who should be held accountable?" In so far as these things can be proven beyond a reasonable doubt, the answers to these questions should be the mitigating factors in deciding both child custody and child support awards; not some antiquated, overly simplified formula.</p> <p>Let's consider this example: A woman enters into marriage, does not stay faithful, refuses to work or provide herself with a career by her own choice (which greatly skews the income between the two), then later chooses to end the marriage, and the father gets 50/50 custody of the children because the courts wouldn't give him full custody. Why should the husband be held responsible for any amount of financial support simply because he was previously the bread winner? In this case, none of the harmful actions that caused the failure of the marriage and put the children into jeopardy were the result of any wrong doing on his part, yet he is penalized by having his children taken away and having 25 to 50% of his after tax income taken from him and given to the mother. She benefits directly from her poor choices. How is that fair? Because it's what's best for the children to maintain their standard of living? Why is the mother not held to a higher accountability for causing their standard of living to be declining in the first place? And why is it assumed that the poor choices of one (or even both) of the parents would even allow the standard of living for the children to remain the same? That is a faulty presumption from the very beginning.</p> <p>Also, why is it that the mother can re-marry to another individual, and that new spouse's income is not factored in? If what is at question here is the standard of living for the children while they are in their mother's care, how is it remotely realistic to completely ignore the adjusted family household income due to the new spouse?</p> <p>Alternately, if the father in this case (the one paying child support), goes on to enjoy career success and his standard of living increases, how is it remotely fair to assume than that the mother is entitled to even MORE money from him? Wouldn't the children's standard of living that they had become accustomed to while the parents were together remain the same if he simply continued to provide the same child support? Yet, because his income goes up, the child support goes up. This is unfair.</p> <p>Life is not as simple as a formula. To exclude common sense from the child support laws is unfair to everybody,</p>

	Commentator	Comments
		<p>including the children, because it only encourages those who can manipulate the system and benefit from it to do exactly that. Ultimately this leads to far more harm to the children than good.</p> <p>The whole system needs to be overhauled.</p>
23.	Member of the Public	<p>The time share factor appears to serve two purposes; 1) the reflect a sharing of child elated expenses, and 2) to encourage non-custodial visitation.</p> <p>Unfortunately, the time share factor spurs litigation because of its financial impact. I also believe the struggle over time share that is financially motivated, results in harm to the children of the relationship. I will not go into detail unless asked to support this later observation.</p> <p>To alleviate the burden on the courts, but still serve the purposes stated above, a floor, significantly above zero should be set, at the discretion of the Judge or Commissioner.</p> <p>For, example, in the case of successful parental alienation, the Court may use a 20% sharing factor despite the limited or absence of contact wrongfully created by the custodial parent.</p> <p>I hope my opinion is helpful and I hope it will be considered at some future opportunity.</p>
24.	Member of the Public	<p>The current formula for what is dishonestly called "Child Support" in California is punitive by design. It is intended to, and does actually, punish almost exclusively fathers as if they were guilty of some crime. A great many sincere people believe that this is completely appropriate. Some have worked hard to inflate the myth of the "able non-payer", that is, a man who has the means to pay but refuses to accept this as his obligation. Some "able non-payers" do exist, but not in the quantity and proportion that the women's hate groups have claimed. Far more often a non-payer is a man living in poverty. But it is hard to generate hatred for these men at the bottom of the economic ladder, and so the myth of a well-off man who simply refuses to pay child support out of selfishness was manufactured.</p> <p>It would be nice to believe that our democratic form of government, crafted by the genius of our founding fathers, makes our nation immune or at least resistant to the hatred born of prejudice sincerely felt and sincerely turned into action by those imprisoned by lesser forms of government. Sadly, each of us knows well of the counterexamples from our history that this is not the case.</p> <p>Repeatedly our history contains episodes where the masses supported the conviction that one group or another did not deserve the justice and protection so brilliantly woven into our Constitution and Bill of Rights. Slavery nearly</p>

Commentator	Comments
	<p>broke our country, and the Jim Crow beliefs have yet to be eradicated in the hearts and minds of all our citizens. The oppression of women, based on sincerely held beliefs about the physiological inferiority of women, took generations to resolve. The internment of American citizens of Japanese descent was endorsed and accepted at the highest level of government.</p> <p>At the height of these oppressive practices, if you had asked the average citizen, they would have expressed outrage at the idea that members of the oppressed groups ought to be treated fairly: that they ought to have the justice and protection promised by the Constitution and Bill of Rights. We were able to be convinced that these groups were not deserving of fairness, and history unambiguously documents that they did not get it.</p> <p>The elected government often embraced the misinformation that supported prejudice, teaching that the negative regard for the oppressed group was justified. And sadly, the courts, time and time again, offered themselves as the tools of bigotry, bending their interpretations of the statute law to serve these irrational hatreds.</p> <p>History also documents that sometimes, it was the courts that led the country out of the vile mire of prejudice.</p> <p>It is sadly easy to connect with our inner prejudice even today. Ask yourself: should we be fair and just to both the mom and the dad in a divorce?</p> <p>The knee-jerk reaction is "Hell no, he is an abandoning weasel!" This is what I learned in my adolescence and early post-college life, without knowing exactly why. That I learned this even though I lived with a powerful counter example is somewhat baffling to me, and I look for something to blame it on. I realize now it is the product of the women's hate groups.</p> <p>When my own parents divorced, my father remained a committed parent to me and my siblings, and I lived with him on and off throughout my college years. But I believed I was one of a lucky few, and that the average divorced dad *was* an abandoning weasel. After college, when I looked for some opportunity to give back some of the prosperity I was enjoying under democracy and capitalism, I volunteered as a Big Brother for 7 years.</p> <p>My own daughter was born in 1994, and I lobbied my wife to live as equal parents, working at part time jobs and enjoying a life where we had lots of family time, but not a trip to Europe every year. She concluded that such a life was not worth living, and left to pursue a better Mr. Meal ticket.</p> <p>I learned that the courts operated with the same beliefs that I had internalized in spite of my own life experience:</p>

Commentator	Comments
	<p>that men were abandoning weasels, and, not fit to be parents, deserve to be punished simply based on their gender.</p> <p>I had to fight, sometimes at great expense, to remain a parent to our daughter. I met many sincere people who had internalized the same anti-male bigotry, and acted as if it were a noble cause to prevent children from spending care giving time with a male parent, even their own biological fathers who dearly love them. An entire industry has evolved whose only purpose is to punish this unworthy victim, the divorced dad, and separate him from his children.</p> <p>And how does one explain these people, profiting from the prejudice of father-hate?</p> <p>The same way one explains those who built internment camps.</p> <p>The same way one explains slave owners.</p> <p>They have "internalized the values," perhaps not only because it profits them, but because they are reinforced by media and cultural prejudices all around.</p> <p>Financial child support is part of this punishment they believe the divorced dad deserves.</p> <p>Since the enactment of the current formula used for child support in California, what has transpired?</p> <ol style="list-style-type: none">1. Lenore Weitzman finally admitted the statistic that made her famous was an error2. CS Enforcement bureaucracies have ballooned, and one has failed only to give way to another that also fails3. The collection of arrearages has not improved, and the more honest think tanks have concluded that 75% are uncollectable as they are owed by adults living in poverty4. A huge amount of CS that was being paid on time in full is now routed through these bureaucracies, increasing their claimed collections without denting the arrearages5. Dr. Warren Farrell published a book explaining many if not all of the statistical differences between average salaries of men and women. Most are explained by women choosing paths that provide some form of fulfillment in lieu of money. <p>That the current CS formula is punitive is undeniable. Excessive support awards prevent men from saving for their children's college.</p>

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

	Commentator	Comments
		<p>Federal codes contribute to the injustice also: CS is Tax free income to mom and ALL THE TAX DEDUCTIONS go to mom. No tax benefits whatsoever to dad.</p> <p>Lawmakers who consider the formula learn how "income shares" works: as a form of "gerrymandering" to transfer tax-free cash into the home of the female parent. It embodies the assumption that *every* dad will decline to support his children, which is untrue and prejudicial on its face. It enables the female parent to hand the child every shirt, dress, pair of pants, and sock that the father parent has paid for, and give the male parent no credit.</p> <p>It is easy to see the injustice of California's "income shares" by spending a very few moments with a support calculator. Start with a fully equal scenario (equal incomes and equal times caring for the children), then change the timeshare by one day per month. more with the mom, then with the dad. The amount of money that shifts over one day difference would outrage anyone who believed in fairness to both parents.</p> <p>I am certain that Lawmakers have the intellectual capacity to understand that it is "Double Billing" to use a cost of living proxy that includes child care and medical costs, yet add statute law that requires that these costs be *added* to the formula amount.</p> <p>Over and over Women's advocates report support calculation results that are erroneously low, and while the errors are pointed out they remain uncorrected.</p> <p>Most lawmakers see this and do nothing, perhaps because you too believe sincerely that the divorced dad deserves to be punished.</p> <p>This formula has succeeded in punishing a great many innocent men. Don't you realize that some of these innocent men are your sons, brothers, cousins, uncles, and sometimes your fathers?</p> <p>Can't you look into your heart and realize that each time we have, as a nation, elected to punish selected groups by denying that Constitutional protections should apply to them, future generations have condemned this as repugnant and shameful? Shouldn't the formula be about fairness, and not about public sentiment distorted by Women's hate groups?</p> <p>I hope it will not take another generation to change the support formula to be fair to the divorced dad. Not all women support the agenda of the hate groups, and one day those who come after you will recognize that you were blinded by the bigotry of your beliefs.</p>

APPENDIX D

Review of Statewide Uniform Child Support Guideline

All comments are verbatim unless indicated by an ellipsis (...).

	Commentator	Comments
25.	Member of the Public	<p>The Child Support Guideline is unrealistic, b/c the judge or commissioner often sets arbitrary monthly income on a parent just because of one's college degree. The current system fails the family & causes so much grief and stress that often a parent who is self-employed can't cope and loses his or her business/job. Current personal and emotional circumstance MUST be taken into account or the unfair Child Support order adds more stress further burdening that parent directly and the family indirectly.</p> <p>The Guideline can be improved by using foster care costs as a guideline and IF the court does consider imputing a parent's monthly wage it must also provide the opportunity for that parent to establish evidence as to his/her current emotional state as it relates to earning power. The court must take into account financial demand according to the parent's circumstances and station in life.</p> <p>It is this parent's opinion that the Family Law system is broken: it creates an overwhelming amount of additional stress for the child and the parents. It drains family savings accounts for the vultures with law degrees. California's broken Family Law system is undermining the fabric of our society because it has failed to provide its citizens basic right to redress grievance. There is an urgent need to reform the California family law system and several nationally recognized parent educators have provided working models which do not include attorneys.</p> <p>The state should provide attorneys in family law like the county does for cases in DCFS. Providing parents with 50-50 physical custody orders reduces one parent's "profit motive" and keeps both parents involved emotionally and financially in the costs of child rearing.</p> <p>The current system rewards the wealthier parent who can afford an attorney. This hurts the child(ren) emotionally because this behavior is aimed at alienating the lesser parent, reducing that parent's time with the child(ren) and increasing that parent's financial obligation.</p>
26.	Member of the Public	<p>California's K Factor should be lowered or removed, since the cost of living is irrelevant because the Guideline is based on percentages of income. In addition, the K factor only applies up to a combined income of \$6,600 a month, above that it goes to the H Factor, which is higher. This is hardly fair to parents like myself who have worked long and hard to become good providers for our families, and now we are de-facto being punished for our success. Reality is that after divorce or separation no one in the family (children nor parents) can maintain the same standard of living after the breakup as before, because the same income which supported one household must now support two, therefore living standards are inevitably going to decline. The Uniform Child Support Guideline should be based on the needs of the children involved and should be related to the actual cost of raising a child. The Review glosses over this very important issue.</p>

		<p>Another very important issue which is totally absent from the guideline must address how BOTH parents have equal responsibility to provide economically for the children after divorce, if they truly wish for their children to maintain their former standard of living, and not just because the "law" so states it. The total responsibility to support the children should NOT be just on the working parent who is being penalized by the current law/guideline for having been an excellent provider while the mother (in my case) sits at home and does not work while expecting to be provided and live at the same standard of living as before taking advantage of the fact that she has been awarded full custody of the children and using THAT fact as an excuse to not work! VERY, VERY FRUSTRATING SITUATION!!!</p>
27.	Member of the Public	<p>The proposed changes fail to address serious and material shortcomings of California CS guidelines and calculation of "K" values, including the following:</p> <ol style="list-style-type: none"> 1. The objective of the guidelines is to "equalize the standard of living between the homes" However, the guidelines consider ONLY household income and not savings. Because the K factor assumes that all income goes to consumption, and there is no recognition that Californians actually save a portion of income, the guidelines go beyond equalizing the standard of living, but also equalize savings (or the opportunity to save) between the homes. This effectively equalizes retirement of the parties which overreaches the letter and intent of the law. Ignoring household saving rates is a serious flaw in the determination of the "K" value and is one of the reasons the awards often result in support payments well in excess of the actual spending per child by intact families as calculated by USDA. 2. Another major flaw in the child support calculations is that the studies on which the K factor is based intend to capture all household spending on children. However, California statute provides that certain expenses such as daycare, healthcare, and tuition should be considered separately. Since these expenses are considered separately, the K factor should be adjusted downward to effectively back out the estimated family spending on healthcare, daycare, and school expenses so that the actual amounts can be added separately. Currently, the guidelines double count these amounts. (i.e., the "K" includes ALL spending, so if healthcare, daycare, etc are added after the fact, K should be lowered to allow for it). <p>Both of these shortcomings are rooted in the flawed econometric "science" conducted by a child support collection agency called PSI and its successor firms (such as Center for Policy Research) all based in Denver Colorado and affiliated with Robert Williams. These groups rely on outdated economic research by 1800's economist Ernst Engle and a single, short duration study from 1984 by Thomas Espenshade to estimate "income shares". Espenshade's income shares study attempted to indirectly estimate how much income welfare families living in Wisconsin were spending on child care based upon changes in family spending on tobacco products. Obviously, such families bear little to no resemblance to typical California families in the year 2011. The gap between Espenshade's test group and contemporary American families shows up clearly as a gross difference in</p>

		<p>USDA actual family spending levels and the typical Child Support order issued by California Family Courts. (Editor’s Note: Please see Chapter 2 of the Study and page ten in particular for a list of the 5 older studies and 4 newer studies used to analyze child rearing expenditures and state guidelines).</p> <p>The state has retained its advisors without competitive bids since 2001. The Council's ongoing use of these firms is a gross disservice to the citizens of California; the science employed by these firms is fundamentally flawed and ripe for constitutional challenge as an arbitrary violation of due process. (Editor’s Note: All child support procurements were publicly solicited and complied with state procurement standards).</p>
28.	Member of the Public	<p>I am writing about the poor and misleading design of California's Family Law form #150 (FL-150), which I believe induces obligors to pay higher amounts in child support than they actually owe. The form implies that the *personal* health expenses of the child support obligor are not eligible to be counted as a deduction for the purpose of calculating child support. This likely creates an assumption by many child support obligors that their own personal health care premiums and expenses (i.e. health premiums for the adult parent's health coverage, distinct from the premiums paid for covering the child) must be paid completely independent of their child support obligation, and as a consequence such obligors are saddled with artificially high child support orders.</p> <p>Here is the relevant section of the state family code. As you can see, the health premiums for the parent -- and not just those for the child -- are to be factored in as deductions in the calculation of child support:</p> <p>CALIFORNIA FAMILY CODE</p> <p>Section 4059. The annual net disposable income of each parent shall be computed by deducting from his or her annual gross income the actual amounts attributable to the following items or other items permitted under this article:</p> <p>(d) Deductions for health insurance or health plan premiums for the parent and for any children the parent has an obligation to support and deductions for state disability insurance premiums.</p> <p>Below are the relevant portions of the form FL-150, Income and Expense Declaration. The URL to the form on the state Web site is displayed below:</p> <p>Income and Expense Declaration (form FL-150):</p> <p>http://www.courtinfo.ca.gov/forms/documents/fl150.pdf</p>

Commentator	Comments
	<p>Below, you'll see that the phrase "total monthly amount" is used, but doesn't specify whether the so-called total should omit or include the parent's health care premiums; it's vague. An obligor could plausibly infer that this item refers to the total monthly amount that he or she pays specifically for the child's health care premiums only, rather than those of the parent too.</p> <p>=====</p> <p>Page 2:</p> <p>10. Deductions</p> <p>* c. Medical, hospital, dental, and other health insurance premiums (total monthly amount)</p> <p>=====</p> <p>Again, in another section the phrase "average monthly expenses" is used, but vaguely doesn't mention that the parent's health care premiums should be included within this figure:</p> <p>=====</p> <p>Page 3:</p> <p>13. Average monthly expenses</p> <p>* b. Health-care costs not paid by insurance</p> <p>=====</p> <p>Page 4 is the key page in factoring in child support; it is specifically entitled "Child Support Information," implying that whatever deductions are claimed here are specific to the formula calculation whereas the preceding pages are not. Notice that the only way that a parent could claim his personal health care premiums on this page is to utilize the last item that mentions "extreme financial hardship." Since when is it an "extreme" circumstance for a parent merely to insure himself? The alarmist language presents a significant disincentive for an obligor to specify his own personal health care premiums in this section, and as a consequence his child support obligation is likely to be calculated at an excessively high figure (in violation of the Family Code 4059(d) that I quoted above.</p> <p>Notice also that the word "children's" is used exclusively, and is actually intentionally singled out in the form by</p>

		<p>being BOLDED in the *printed* form's text (the bolded portion is shown below, on item 17d, in capital letters)! This is what I meant when I used the phrase "glaring subtlety" to refer to this poorly-designed (and apparently intentionally misleading) form:</p> <p>=====</p> <p>Page 4</p> <p>Items 16-20: "Child Support Information"</p> <p>17. Children's health-care expenses</p> <p>* d. The monthly cost for the CHILDREN'S health insurance is or would be (specify): \$ _____</p> <p>18. Additional expenses for the children in this case</p> <p>* b. Children's health care not covered by insurance: \$ _____</p> <p>19. Special hardships. I ask the court to consider the following special financial circumstances:</p> <p>* a. Extraordinary health expenses not included in 18b: \$ _____</p> <p>- The expenses listed in a, b, and c create an extreme financial hardship because (explain):</p> <p>=====</p> <p>Again, why should the state's form so thoroughly emphasize only the health premiums and uninsured expenses for the children, while implying that any mention of the parent's health premiums and expenses should be considered so "extraordinary" that they somehow represent an "extreme financial hardship," requiring the parent to "explain" them? Isn't it normal for a parent to insure himself? Isn't it in the child's best interest for the parent to have health coverage for himself?</p> <p>California's FL-150 Income and Expense Declaration form is sorely misleading, inadequate, and in direct contravention of the state's Family Code section 4059(d). The parent's personal health care premiums and uninsured expenses should absolutely be included as a deduction in the state's formula for calculating child support, and I suspect that this form is causing too many parents to unwittingly be obligated to pay more child support than</p>

	Commentator	Comments
		they actually owe under state law. (Editor’s Note: This comment has been forwarded to Administrative Office of the Courts staff for review of comment relating to Form FL-150).
29.	Member of the Public	The Child Support Guideline is grossly unfair, unrealistic, and does absolutely nothing to stop the severe human rights violations against good, loving parents (especially fathers)...
30.	Member of the Public	<p>The most important changes needed are)take away the incentive to ask for custody to avoid paying support; 2) 1) Unfortunately, I hear case after case where a parent who had no interest in raising the children before the divorce, will fight for full custody to avoid child support obligations. In my perfect world, there would be no child support and 50/50 custody, except in cases where the child testifies to physical abuse.</p> <p>Perhaps there could be a rule, if a child is left with a third party, the other spouse has first right of refusal, and any time taken by the other spouse is compensated at the same rate as daycare. So, starting at 50/50 presumption, if A leaves the child with a nanny 24/7, B can opt to take the child all that time and be compensated \$10 per hour, 24 hours per day, 3.5 days per week. That is \$840 per week or about \$3500 per month. That is worst case, if A wants to spend no time with the child.</p> <p>If the parents agree to a different time share, say B gets 90%, if A still leaves the kids with a nanny during his entire time, he only pays B 1/5th the above figures. This encourages A to take less custodial time if he plans to hire someone to watch the children for him.</p>
31.	Member of the Public	The Child Support Guideline is arbitrary and unfair. In my case, the family residence in which the mother resided with the children was essentially paid off, with only negligible monthly recurring costs for insurance/taxes. The Guideline made no exception for the amount of money the father had to pay for spousal/child support based on the fact that the family residence had been paid off. This provided the mother with excessive monthly income, and stripped the father of needed cash flow to pay his own monthly costs. Accommodation needs to be made for actual costs, not just a standard formula. This was a huge financial burden in my case.
32.	Member of the Public	<p>I participated in the Burbank focus group, which was recorded.</p> <p>Chapter 6 of the Draft Report is factually incorrect, and is in effect misleading as to the input from stakeholders.</p> <p>In general, the participants very deliberately and clearly communicated the current Guideline that California uses is fundamentally flawed and does not work. It increases litigation of custody/visitation, and is a great SOURCE of conflict between parents. This should have been reported to the Legislature in at least as clear a manner as it was reported to the Judicial Council's research contractor.</p> <p>Instead, great editorial license was taken such that the reporting of the stakeholder input reads as if the court users</p>

	Commentator	Comments
		<p>support the premises: the Guideline is substantially fine, only minor changes are needed, and that court users just need to be "educated" to make the Guideline work. It would have been more appropriate for the Judicial Council's research contractor to have reported the court users' input that the current Guideline is in need of substantial change without editing out the message.</p> <p>Moreover, the Judicial Council's research contractor edited the stakeholder input to the point of being factually incorrect. Even though the majority of participants in the Burbank meeting said that child support should not be based on a percentage of a parent's income, but rather on the Actual Cost of Raising a Child, the Judicial Council's research contractor reported that "One participant in Burbank agreed with this viewpoint, but most of the other participants in Burbank felt that this method would be unreasonable" (p. 118). This is factually incorrect. The record should be reviewed and this should be corrected. In fact, the common unifying theme of most court users in both the San Francisco and Burbank meeting was that the basis of the current Guideline should be the Actual Cost rather than a percentage or share of income. The stakeholders should not be silenced through the editorial process.</p> <p>Finally, "data interpretation" on the surveys should have been provided. Surveys are amenable to "interpretation". Review of the raw data provided clearly indicates that the current Guideline does NOT meet the policies set forth by the Legislature. Basic survey reporting would clearly indicate that certain policies are more strongly not being met than others, and this should have then been tied to the oral input of the participants. Again, this would end in the conclusion that the current Guideline is in need of substantial change. [One reason for this is because modern family patterns differ substantially from those that existed when the current support model was developed -i.e., times have changes, but the model hasn't.]</p> <p>Had the input from stakeholders been reported accurately, a reasonable Recommendation would have been to "form a diverse task force representing all stakeholders (rather than just court users) to explore the possibility of updating the Guideline in more than just a superficial manner." This process should be conducted publically, transparently, and on the record.</p> <p>Consultant's Response: Chapter 6 does not state or imply that participants of the focus groups view the Guideline as "substantially fine" and "only minor changes are needed" as the commentator purports. To the contrary, Chapter 6 states that one of the major themes of the focus groups is that participants do not believe the current Guideline is fair (3rd bullet on page 114) and identifies several <i>major</i> changes recommended by participants. Pages 116-119 detail the reasons why participants think the Guideline is not fair. It uses the participants' unedited words and includes the commentator's point that the Guideline increases custody/visitation litigation and conflict between the parents (see second and last paragraphs of page 116). Chapter 6 also identifies many recommendations that would</p>

	Commentator	Comments
		<p>produce major Guideline changes such as the recommendation of some participants to base the Guideline on 50/50 custody and make 50/50 custody presumptive in family law statute (page 116), the recommendation to increase the low-income adjustment (page 117), and several others. Chapter 6 <i>does not state</i> that only one Burbank participant believes that the Guideline should be based on actual child-rearing cost as the commentator purports. The point of the discussion on page 118 is that the San Francisco and Burbank focus groups differed on whether <i>income</i> should be considered in the Guidelines calculation, not that they disagree on basing the Guideline on child-rearing costs. Some of the San Francisco participants insisted that the parents' incomes should not be considered in the Guideline calculation, rather the Guideline should be based on a fixed amount to cover the cost of child rearing similar to foster care payments. In contrast, as discussed on page 118, several Burbank participants believe that because high-income parents spend more on child rearing than low-income parents that the Guidelines calculation should indeed consider income. As discussed in Chapter 2, there are various methodologies for measuring child-rearing costs and several guidelines models. Some methodologies do consider income and others do not. Most guidelines models used by states, including the California Guideline, consider income and rely on measurements of child-rearing costs that relate to income, albeit the models differ and they do not all rely on the same measurements. There are also other guidelines models that aim to provide the child with the same standard of living in both parents' households. Thus, they consider each parent's income but not the cost of child rearing. Since the information from Chapter 2 was not provided to participants in advance of the focus groups and is technical, participants were not expected to use the same concepts and definitions provided in Chapter 2. Nonetheless, Chapter 6 contains the stakeholder's unedited input and was not edited to be consistent with the terms and concepts used in Chapter 2. Moreover, with the exception of being California based, most participants did not elaborate on what they meant by actual child-rearing cost and often intertwined it with other concepts they believed should or should not be considered in the Guideline. For example, some participants explicitly stated the Guideline amount should be based on a presumption of equal custody and other participants explicitly stated the Guideline should not be based on parents' incomes. Other specifications that were mentioned included using a marginal cost methodology, that measuring housing expenses accurately was key to an actual measurement of child-rearing cost, and the cost should consider three-income tiers (e.g., low, middle and high incomes). In all, the view that the measurement of child-rearing cost is worthy of further study is captured in the third bullet of page 119 that states "A number of participants expressed general concerns about the economic basis of the Guideline. These participants believed that the economic studies should be reexamined."</p>
33.	Member of the Public	<p>Mother's/Father's who are paying child support should be able to claim their children as dependents on their taxes.</p> <p>Mother's/Father's who are receiving child support should have to account for child support as income...</p>
34.	Member of the Public	<p>Child support needs to be abolished entirely much less debtor's prison for it. In light of an economy that has over a</p>

		9% unemployment rate, child support orders are simply Government ordered incarceration based on poverty level. Abolish child support as the slavery mechanism it is.
35.	Member of the Public	This process is totally one sided to the women in the support category. My ex-wife quit her job and then I had to pay extra, and my expenses were never allowed to be accepted. On top of that, once I got custody of my son, my ex was suppose to pay support and refused and the courts refused to enforce the policy. I am still owed over \$7,000 from my ex, and the state refuses to enforce the issue, and that is now for over 4 years. Please contact me and take this on and enforce the laws for both sides and not just against the fathers.
36.	Member of the Public	<p>Thank you for the opportunity to comment on the Review of California’s Statewide Uniform Child Support Guideline.</p> <p>Termination of Support and Support Beyond Majority:</p> <p>Termination of child support should be the age of 21, or 23 if the child is enrolled full time at an accredited institution of higher learning. 18 year-old children rarely have the capacity to support themselves right out of high school. The parent whom the child is principally dependent should not carry the sole burden of providing basic living expenses and college tuition; rather these expenses should be shared by both parents.</p> <p>Child Support Guideline for High Cost Counties:</p> <p>Guideline child support should be calculated based on the county in which the child primarily lives. For example, as of June, 2010, fair market rent for a three bedroom home in Los Angeles was \$1,828, but the same three bedroom home in Glenn County was \$939 - a difference of \$889. This results in inadequate child support awards for custodial parents raising children in high cost counties.</p> <p>Health Insurance/Uncovered Medical Expenses:</p> <p>Non-custodial parents in non-IV-D cases, who are ordered to provide health insurance coverage and a contributive share of reasonable uncovered medical expenses, but fail to comply, compromise the health of their children. In light of the uncertainty surrounding health care reform, an administrative mechanism should be put in place to guarantee compliance with the provision of health insurance. Additionally, custodial parents in non-IV-D cases have a very difficult time obtaining reimbursement from non-custodial parents for uncovered medical expenses. The local child support agencies refuse to enforce the orders, leaving custodial parents with medical bills that can’t be paid. This results in derogatory credit reporting and collection actions since the custodial parent is held liable for the entire bill. There is nothing fair or equitable about this for the custodial parent. New legislation should be</p>

	Commentator	Comments
		<p>considered requiring medical providers to limit their collection activity to the court ordered contributive share of each parent.</p> <p>Guideline Child Support for High Earners With Less Than 10% Timeshare:</p> <p>The current guideline is far too lenient toward high earning non-custodial parents who choose to spend 10% or less of their time with their children. They have shunned their parental responsibilities and have created a heavy financial and physical burden for the custodial parent. Further, the custodial parent’s capacity to earn is diminished due to the amount of time needed to care for the children. For the purpose of illustrating this, the online California Guideline Child Support Calculator was used with the following parameters: two children, combined income of the parents-\$200,000. The non-custodial parent has chosen to move away from the children, resulting in a 0% timeshare, has gross wages of \$10,417 per month, and files taxes as “Single.” The custodial parent has gross wages of \$6,250 per month and files taxes as “Head of Household.” The online Department of Child Support Services California Guideline Child Support Calculator results in a \$2,028 per month child support award to the custodial parent. This child support obligation represents 19% of the non-custodial parent’s gross income, and 31% of net income.</p> <p>According to the June, 2010 California Budget Project publication, “Making Ends Meet: How Much Does It Cost To Raise a Family in California?”, the basic family budget (not an upper middle class family budget) for a single parent family is \$5,353, which is more than twice the \$2,028 child support award in the above illustration.</p> <p>It is time to send a clear message to parents who abandon their children - and the message is, if you choose not to spend time with your children, guideline child support will increase considerably. The guideline should be modified to a minimum of 40% of net income for non-custodial parents earning \$100,000 or more per year, and should not decrease until the non-custodial parent’s income reaches \$250,000.</p> <p>Focus Groups With Stakeholders:</p> <p>Future reviews of the Statewide Uniform Child Support Guideline should encourage more participation from middle and upper class custodial stakeholders in focus groups, as the comments in this review primarily focused on low income obligors.</p>
37.	Member of the Public	<p>This Review of Statewide Uniform Child Support Guideline properly determined that California's guideline child support formula is at the high end of the range of measurements of child-rearing expenditures. Meaning California's child support system is very costly to the non custodial parent and very lucrative to the custodial parent, in most</p>

	Commentator	Comments
		<p>cases.</p> <p>This child support system monetarily encourages custodial parents to reduce the non custodial parent's parenting time to achieve higher child support being rewarded. This makes a bad situation even worse.</p> <p>This system benefits the custodial parent in every instance and hurts the non custodial parent. This alienates the non custodial parent from the children's lives.</p>
38.	Member of the Public	<p>Unfortunately the Review was barely publicized, and in the pattern of earlier reviews did not address any of the significant issues for parents, affecting their children, related to expenditures on children and the amount of child support the guideline presumes should be ordered--which are especially pressing in this time of pervasive economic turmoil and sometimes excruciating financial distress.</p>
39.	Member of the Public	<p>The California Guideline Calculation should be done away with. Anything so complex that a person cannot understand how their support is calculated does not serve the citizenry well. It is a bureaucratic governmental calculation that does not serve the families or taxpayers of California. It also discriminates against the working poor and the non-custodial parent. The working poor can be assessed with a support order where a non-working parent with government benefits receiving a higher income is not assessed with support.</p> <p>If the custodial parent can choose not to work then the same right should be given to the non-custodial parent. Each parent should be given the standard poverty level as a deduction to their income (no matter what the source of the income is including government benefits/welfare. Take whatever combined income is left and figure out the percentage of the available income to base the support amount.</p> <p>If there is no available income - the support order should be zero.</p> <p>Neither parent should have "imputed" income. A person has a right to make a choice to not work or to work at whatever job they choose. We are a free society. A person also makes the choice to not function as a family unit. Society should not have to pay for that choice.</p> <p>We should not reward people for having more children than they can afford to support. The oldest child should be given the highest findings - not the youngest.</p> <p>Another simplified way to collect support which would eliminate the constant need for modifications and ease the burden of taxpayer funded child support agencies is to create a child support tax withholding (based on welfare reimbursement tables if the income exceeds the poverty level). If a court order to withhold the support tax is served</p>

	Commentator	Comments
		<p>- the deduction is made.</p> <p>If the custodial parent wants more than the minimum tax -a supplemental order can be sought by the custodial parent - not a governmental agency.</p> <p>This approach would save taxpayers money as it would reduce the involvement of the child support agencies and require less resource to run the program that is already "bloated" by duplicated administrative costs.</p> <p>Not only should the calculator be totally revamped - so should the entire child support program.</p> <p>Child support should be collected and disbursed directly to the family. If the family is aided the support should be claimed as income. Income reporting is already a process that is in place.</p> <p>The child support accounting is ridiculously complex and there is no need for child support to pass through a third party. Again this would save the taxpayers millions of dollars reducing the child support agency costs.</p>
40.	Member of the Public	<p>I am writing in response to an invitation to comment for the public on the latest “Review of Statewide Uniform Child Support Guideline 2010”, dated November 2010...I have a Bachelors degree in Mathematics from San Jose State University and have been a resident of California since 1982. I would like to bring your attention to one very significant, non-disputable calculation error (i.e. $2+2 = 5$) of the current Statewide Uniform Child Support Guideline, based on Family code section 4055(a) and used in California since 1992.</p> <p>Besides calculating the child support payment due, the formula computes a few intermediate results, which can be looked at independently. The most important of these is the percentage of net disposable income (as defined in the family code) allocated to the children. One would presume the income allocated to the children to always be lower than 100% (the parents surely must need some income to survive). In fact, in a number of cases the percentage of income allocated to the children by the current Child Support Guideline is above 100%. Keep in mind that this allocation of income to the children is before any additional allocation for educational, un-reimbursed health, and child care expenses (as permitted by law). Since this allocation of income to the children is then used to calculate the actual child support payment, it is fair to conclude that the validity of the child support payment amount in these cases is in question.</p> <p>The percentage of income allocated to the children is based on the following inputs to the formula:</p> <ol style="list-style-type: none"> 1. K-fraction (as defined in study) is computed using the Parents’ combined disposable net income, as follows:

	Commentator	Comments
		<p>for the parents. This is clearly an indisputable math error in the guideline.</p> <p>I understand that the current guideline has been a source of controversy and disagreements over the years, but hopefully all parties involved can agree that allocating 100% or more of the disposable income to the children alone, and leaving no income for the parents to sustain themselves must be considered a serious breach of mathematical rules and common sense. The guideline can be shown to breach the 100% threshold when applied to families with 7 or more children. However, it produces questionable results even when applied to smaller families, as shown below. Any fix to the guidelines is likely to affect most users of it, including smaller families, so the potential impact of these errors is quite broad.</p> <p>A related policy decision, which also needs resolution, is to determine what percentage of income is reasonable to allocate to the children. Clearly allocating 100% or more is wrong, but can it ever be justifiable to allocate 99%, 98%, or even 93% of disposable income to the children and leave only 7% to the parents. The current guideline makes these kinds of questionable allocations even more frequently. I have no doubt that some of the objections and issues with the guideline identified in the review are rooted in these disparities of income allocation, particularly when there is a shared custody arrangement and a large difference in income between the parents.</p> <p>For example: In a family with five children where the combined net disposable income is \$6,000 and the parents share equal custody (TN=\$6,000, H% = 50%, and 5 children), the actual computation is as follows:</p> $\begin{aligned} \text{Percent of income allocated to children} &= k\text{-fraction} * \text{timeshare factor} * \text{No. Children multiplier} \\ &= 0.25 * 1.5 * 2.5 = 0.9375 = 93.75\% \end{aligned}$ <p>In this scenario each child is allocated 18.75% of income, whereas each parent is allocated only 3.125%.</p> <p>For example: In a family with four children where the combined net disposable income is \$1,500 and the parents share equal custody (TN=\$1,500, H% = 50%, and 4 children), the actual computation is as follows:</p> $\begin{aligned} \text{Percent of income allocated to children} &= k\text{-fraction} * \text{timeshare factor} * \text{No. Children multiplier} \\ &= 0.25 * 1.5 * 2.3 = 0.8625 = 86.25\% \end{aligned}$

	Commentator	Comments
		<p>In this scenario each child is allocated 21.5625% of income, whereas each parent is allocated only 6.875%.</p> <p>I would appreciate your inclusion of the above letter in its entirety (less my address), to the public feedback section of the study. I would be even more appreciative if someone fixed the math problem in the guideline, so that I could once again tell my children with confidence that our Judicial and Legislative branches of Government are fair and balanced in their administration of our laws.</p>
41.	Member of the Public	<p>The corrupt system created and called family law should be abandoned - All STATES ARE ON WELFARE because you had sanctioned independent license holders stopping them from working ruining family's throughout the nation. End family law and let Americans go back to work, government involvement into family lives is simply Communism</p>
42.	Member of the Public	<p>I do not agree with the Child Support Guideline, although I am at the end of raising my children, my experience with Child Support included a father who misrepresented his income, quit his job voluntarily, then petitioned the courts to lower his child support, because he was starting his own business, which would within 1 to 2 years would increase his income, which the children would then benefit from, and he would be able to teach them the business to ensure their future financially. During this time, after the judgment to indeed reduce child support, I found out that the father was engaged to be married, and was moving 1,000 miles away. At first, his wife paid child support, but then they divorced and he sees his children 3 to 4 times a year, instead of the court order of every other weekend, and once during the week. My proposal is that there is no follow-up in a case such as this. The judge (who was retired but called in to sub) slept through half of the proceedings!</p> <p>This left me to raise two children on an on-again, off-again support system, and because his second wife was quite wealthy, he was able to take them to Europe, skiing in Colorado, Hawaiian vacations, and yet my child support was never increased during our divorce, which began in 1996. I do not have the income to return to court since all of my wages went to maintaining a household. I believe that child support should be reviewed every 2 to 3 years, at minimum. My ex-husband was physically violent with me during our marriage, and was arrested for battery, and I am afraid to confront him on my own. So (as I am sure he hoped) I left well-enough alone. But this is not the ideal and with follow-up, after a change of support, might avoid what our family experienced.</p>
43.	Member of the Public	<p>Plaintiff wishes to determine her rights given the current controversy and a determination of whether she is entitled to a quarantine of one-half of her husband's earnings prior to any child support calculation being made, as well as a determination as to her rights to 50% of his income for 2008, or at a minimum 38%, as awarded to her as temporary alimony from the State of Husband's, until as such time the marital situation of Plaintiff is finalized, dissolved or in the event she chooses to remain married.</p> <p>The controversy between the parties cannot be resolved without judicial intervention and there is no known legal</p>

Commentator	Comments
	<p>authority that addresses the issues in this particular case. The Family Code addresses a subsequent spouse but not an existing spouse who is dependent on her husband's income for her sole means of support. An exemption is given to a step-parent's earnings and plaintiff asserts that this is a case wherein a deviation from guideline is appropriate because plaintiff is not a party to the situation nor the parent who incurred the debt.</p> <p>Declaratory relief is necessary in this case to determine whether defendants must consider a non-earning, non-parent spouses one-half community property interest in the working (parent) spouses earnings, when performing child support calculations for a child not of the marriage...</p> <p>Injunctive relief is appropriate to prevent Defendants from continuing to garnish Plaintiff's Husbands income until a determination of Plaintiff's rights with respect to his income at 50% based on community property laws.</p> <p>The controversy cannot be resolved through the administrative means provided by defendants because all administrative remedies are futile or exhausted because they are not designed to provide assistance to a non-earning, non-parent spouses whose community property rights are being ignored. Plaintiff attempted to resolve this issue by telephoning Defendants and upon review they claimed she had no exemptions. Statute allows for deviation from guideline in calculating child support when there are unusual circumstances existing.</p> <p>Plaintiff is seeking a determination of her rights under California Community Property Law, Codes of Civil Procedure, and Family Code with respect to her one-half interest in her husband's earnings as calculated by Defendants when determining child support.</p> <p>Under California Family Code section 751 a spouse has an existing, equal and present interest in all community property acquired during marriage and earnings of a spouse are considered community property. Furthermore, Family Code section 915(a) states a child support obligation of a married person that does not arise out of the marriage shall be treated as a debt incurred before marriage. Hence, Plaintiff's interests in her spouse's earnings ought to be protected, similar to those of a stepparent's earnings, since she has no other means of support (earnings) and has never worked during their entire 25 year marriage.</p> <p>Under California Code of Civil Procedure section 703.020 a spouse may claim exemptions to money judgments placed on her community property and Code of Civil Procedure section 703.070 clearly states that this exemption privilege applies to any child support judgment. Therefore, plaintiff is entitled to a determination of her rights as to the affect of her husband's child support obligation as it effects her property interests and rights in his earnings.</p> <p>There exists a justiciable controversy as to whether any administrative processes are available to a non-earning,</p>

		non-parent spouse, served by defendants that could actually provide a viable remedy to the alleged wrongs set forth above. Plaintiff alleges, as a matter of fact, that the current administrative remedies and procedures offered by defendants do not provide any potential remedy for plaintiff. Actual relief is unavailable and inadequate because defendants have no means of taking into consideration a non-earning, non-parent spouse's one-half community property interest in the parent spouse's earnings, unless so ordered by the court.
44.	Member of the Public	I think it is stupid to have rules that you let men just get over on my x owes thousands and all you do is make him pay a token amount to get his license back they will never pay unless you really make them.

APPENDIX D

Project Staff Biographies

Jane Venohr, Center for Policy Research (CPR) Economist and Research Associate. Jane Venohr was the guideline review project manager. Dr. Venohr is one of the nation's leading experts on child support guidelines and has worked with more than 30 states to develop and review their child support guidelines in the last 20 years. Since joining CPR in 2007, Venohr has led child support guidelines projects for 18 states, directs the Texas *Niños Sanos* evaluation, and has conducted numerous research projects on child support and child care for state and federal government agencies and foundations. Dr. Venohr holds a PhD in economics from the University of Colorado.

Jessica Pearson, CPR Director. Jessica Pearson was the assistant project manager for this guideline review. Dr. Pearson is a nationally recognized expert on child support issues. She was the lead researcher for the national evaluation of the Access and Visitation Demonstration Projects and the Responsible Fatherhood Demonstration Projects. She has worked closely with many state and local child support agencies on the design and successful implementation and evaluation of major demonstration projects dealing with hospital-based paternity, incarcerated noncustodial parents, child support arrears, victims of domestic violence, responsible fatherhood, and numerous enforcement remedies and interventions aimed at improving child support collections. Dr. Pearson has been published extensively on child support topics and is a regular presenter at national conferences for the child support and judicial communities. Dr. Pearson holds a PhD in sociology from Princeton University.

Nancy Thoennes, CPR Associate Director. Nancy Thoennes analyzed case file data. Dr. Thoennes has been the coprincipal investigator for virtually every child support project CPR has conducted, with the exception of the guidelines projects. One of her most substantial data analysis activities was the analysis of The Violence Against Women Survey, which involved telephone interviews with national probability samples of 8,000 women and 8,000 men to gather information on the extent, nature, and consequences of various forms of violence, including partner violence, sexual assault, and the first national study on stalking. Dr. Thoennes holds a PhD in sociology from the University of Denver.

Rasa Kaunelis, CPR Research Associate. Rasa Kaunelis managed and analyzed case file data for this guideline review. She also managed and analyzed the data for the Arizona child support guidelines review. She is currently working with the child support workforce agency, and court in Arapahoe County, Colorado, to collect information on unemployed noncustodial parents who are referred to an innovative seek-work program. She is also monitoring data collection in a multisite investigation of the effects of outreach to pregnant and new parents about paternity and child support. Ms. Kaunelis was a key researcher on a study for the National Campaign to Prevent Teen and Unplanned Pregnancy on methods of outreach to young men about unplanned

pregnancy. She has worked with child support agencies; Women, Infants, and Children (WIC) programs; workforce agencies; and courts in multiple settings. Ms. Kaunelis holds an MPA from the University of Colorado.

Carly Everett, CPR Research Associate. Carly Everett conducted extensive qualitative research and literature searches and assisted with calculating child support amounts under various case scenarios, focus groups, and writing the report for this guideline review. Ms. Everett joined CPR in January[2010?]. Prior to that time, she was an attorney in Indianapolis, Indiana, practicing in a variety of areas, including mental health, family, medical malpractice, competitive business, bankruptcy, labor and employment, and tax. Ms. Everett also conducts nationwide, extensive research regarding effective practices in streamlining child support modification procedures. She additionally provides back-up, general assistance for many of CPR's projects, including prisoner reentry programs and medical support programs. Ms. Everett holds a JD from Indiana University and is on track to obtain an MPA. from University of Colorado in May 2011.

David Betson, Economist. David Betson conducted original research on child-rearing costs (e.g., the cost of raising children in California) for this guideline review (see Appendix A). Dr. Betson's measurements of child-rearing expenditures form the basis of almost 30 state child support guidelines, which is more than any other measurement. He conducted his original research on child-rearing expenditures for the U.S. Department of Health and Human Services in 1990 using five different estimation techniques. His 1990 research fulfilled a congressional mandate and was aimed to assist states with the development and review of state child support guidelines. Dr. Betson is also a member of the National Academy of Science and is affiliated with the Institute for Research on Poverty at the University of Wisconsin. Some of Dr. Betson's most recent research concerns the impact of the WIC program on baby formula prices. He holds a PhD in economics from the University of Wisconsin and is an associate professor of economics and the former director of the Hesburgh Program in Public Service at the University of Notre Dame.

Paul Legler, Research Associate. Paul Legler assisted with the focus groups, the literature review on low-income families, and other analysis. Most of Mr. Legler's work over the past eight years has focused on developing more sensible child support policies for low-income parents. Currently, Mr. Legler is the project director for a demonstration project in Hennepin County, Minnesota, that will provide parenting education, access, and visitation services, employment assistance, and other assistance to parents with new orders. Some of Mr. Legler's other child support projects include the Memphis Initiative to Promote Parental Responsibility and Healthy Marriages (Tennessee 2006); Breaking Down Barriers to Voluntary Paternity Establishment (Minnesota 2005); Strengthening Families, which assisted custodial and noncustodial parents with family issues at the time of TANF applications (Hawaii 2006–2007); and Low-Income Fathers Pilot Demonstration Project (Louisiana 2004–2005). Mr. Legler is the author of *Low-Income Fathers and Child Support: Starting off on the Right Track*, published through the Annie E. Casey Foundation. Mr. Legler holds a JD from the University of Minnesota

and an MPA from Harvard University, John F. Kennedy School of Government. He currently is the president of Innovative Social Policy, LLC.

Kelli Kreycik, CPR Office Manager. Kelli Kreycik assisted with data entry and project management. Ms. Kreycik holds a BS degree from the University of California, Berkeley.

David Youngstrom, CPR Research Assistant. David Youngstrom assisted with data entry for the guideline's case file review. Mr. Youngstrom has worked with CPR since 2009, performing various tasks including assisting with data entry and phone interviews with noncustodial fathers in Tennessee and Arapahoe County, Colorado. He also works with Greenprint Denver to promote energy efficiency and green living. Mr. Youngstrom previously worked as the national account manager for the Ingram Book Company and Baker & Taylor, the two largest book wholesalers in the country.

Nick Anderson, CPR Research Assistant. Nick Anderson assisted with the guideline review by calculating child support amounts for several states under various case scenarios. He also assisted with data entry. Mr. Anderson holds a BS degree from the University of Colorado.

Marsi Buckmelter, Editor. Marsi Buckmelter holds a BA in English and an MS in technical communication, both from the University of Colorado.

APPENDIX E

Acknowledgments

This report was prepared under the direction and oversight of the Judicial Council's Family and Juvenile Law Advisory Committee. At the time the report was prepared, the committee was co-chaired by Hon. Kimberly J. Nystrom-Geist and Hon. Dean Stout, and its members were Hon. Sue Alexander, Hon. Lorna A. Alksne, Hon. Craig E. Arthur, Hon. Patricia Bamattre-Manoukian, Ms. Judy Lynn Bogen, Hon. Jerilyn L. Borack, Mr. L. David Casey, Ms. Emberly Cross, Mr. Frank Dougherty, Hon. Sherrill A. Ellsworth, Hon. Barry P. Goode, Mr. Matthew Golde, Ms. Vickie Scott Grove, Ms. Leslie Heimow, Hon. Margaret Henry, Ms. Katheen Hrepich, Hon. Susan D. Huguenor, Hon. Mark A. Juhas, Ms. Patricia Kaplan, Ms. Darlene Azevedo Kelly, Ms. Patricia Lee, Hon. Thomas Trent Lewis, Hon. Cindee F. Mayfield, Hon. Michael J. Naughton, Hon. Michael Nash, Mr. Jerry Powers, Ms. Charlene Reid, Hon. Frances Rothchild, Hon. Marjorie S. Steinberg, Hon. Patrick Tondreau, Hon. Terry Thanh Truong, Ms. Claire Williams, Ms. Lauren Zorfas, and Hon. Arnold D. Rosenfield (Ret.).

Staff from the Administrative Office of the Courts assisted in the execution of this project and preparation of this report: Jamie Lau (Project Manager), Irene Balajadia, Stacie Clarke, Charlene Depner, Marita Desuasido, Paul Fontaine, Mimi Ly, Anna Maves, Linda McBain, Ruth McCreight, Amy Nuñez, Diane Nunn, Stephen Saddler, Jill Whelchel, and Michael Wright. The report was edited by Fran Haselsteiner.

The California Department of Child Support Services consulted with local child support agency representatives and advocates to obtain broad input in the development of additional research questions which were shared with the AOC and integrated into the study.

Thank you to the focus group participants from various advocacy groups and to the child support commissioners from the 11 study counties for their insight and help with interpreting the preliminary case file review findings.

Lastly, the case file review was an essential part of this study. It could not have taken place without the invaluable assistance from the court executive officers and their staff in the 11 study counties who arranged the reviews locally, and from our contracted case file reviewers Richard Altimus, Linda Cianciolo, Melbourne Gwin, Jr., and Wendy Dier who spent many hours reviewing case files.
